1 Introduction

1.1 Portfolio Overview

The microwave antenna portfolio ranges from 0.1 m to 3.7 m and from 4 GHz to 80 GHz.

Depending on frequency and antenna size different versions are available:

- Reflector antennas and flat panel antennas
- High performance and super high-performance antennas
- Single polarized and dual polarized antennas
- Dual band antennas, combining two frequency bands in one antenna
- Integrated antennas and antennas for separate installation

The antennas are used for both short haul (SH) and long haul (LH) systems.

Please see section 2 for a complete list of all different antennas available for the different systems.

1.2 Polarization

Single polarized antennas radiate in one polarization, vertical or horizontal polarization. The polarization is adjustable and is set at site during the installation.

Dual polarized antennas radiate in two polarizations simultaneously, vertical and horizontal polarization. The antenna has two ports, one for each polarization.

1.3 Performance

1.3.1 Radiation Pattern Envelope (RPE)

High performance antennas fulfil ETSI RPE class 3 (0.1 m 60 GHz class 2).

Super high-performance antennas fulfil ETSI RPE class 4, with only a few exceptions fulfilling class 3. The antennas have got an integrated radome, which protects the antenna from its physical environment (rain, snow, dirt, wind etc). The antennas are suitable for networks with a very high interference potential.

1.3.2 Return Loss

The system requirement on antenna return loss is:

Short haul	5-80 GHz	14 dB
Long haul	4-8 GHz	18 dB
Long haul	10-13 GHz	14 dB

1.4 Integration

The integrated antennas are installed with the radio unit without using any flexible waveguides, i.e. the radio is fitted directly to the rear of the antenna. The radio unit can easily be dismounted without affecting the antenna alignment.

All antennas (including the integrated antennas), except 80 GHz, can be installed separately from the radio unit using a flexible and/or elliptical waveguide. The antennas are equipped with a standardised waveguide interface (see section 4.3.2). The 2.4-3.7 m antennas are always installed separately from the radio unit.

The 0.1 m 60 GHz antenna is integrated in MINI-LINK 6351 and cannot be separated from the radio.

1.5 Kit Form

To reduce transportation and storage volume and cost the antennas are delivered as a kit, which must be assembled at site before the installation. The 2.4-3.7 m antennas are delivered with the reflector split in two pieces.

1.6 Modular antennas

Part of the antenna portfolio has got fixed radio interfaces (traditional way) and part of the portfolio has got a modular approach. Antennas with fixed interfaces have product numbers UKY 2** **/**** and modular antennas have product numbers BFZ 622 **/****. Modular antennas are available for sizes 0.3-1.8 m.

Modular antennas are upgradeable from single to dual polarization and from one radio type to another by replacing the Interface module.

It is not possible to change the frequency band of the antenna by replacing the interface, since also other parts in the antenna are frequency dependent.

For detailed information regarding the Interface module, see 1301-URS 199 01+.

The Interface module must be from the same supplier as the antenna. Interface module A can only be used with an ANT A antenna and the Interface module B can only be used with an ANT B antenna.

1.7 Dual band antennas

Dual band antennas combine two frequency bands in the same antenna, a traditional band (e.g. 15, 18, 23 GHz) and E-band (80 GHz).

Single polarized (HP/HP) dual band antennas radiate in one polarization both for the traditional band and for the E-band. The polarization for the traditional band and the polarization for the E-band can be set in vertical or horizontal polarization independent of each other.

Dual polarized (HPX/HP) dual band antennas radiate in two polarizations (vertical and horizontal) simultaneously for the traditional band and in one polarization for the E-band. The polarization for the E-band can be set in vertical or horizontal.

1.8 MINI-LINK 6366 Compatibility

The outdoor modem unit MINI-LINK 6366/1 and MINI-LINK 6366/4 can be installed integrated with the ANT3 HP and ANT3 HPX antennas or installed close to the antenna on a pole or a wall.

The MINI-LINK 6366/1 and MINI-LINK 6366/4 can be installed according to Table 1, this for ANT A, ANT B and ANT C.

¹ Limited Antenna side strut angle and access inside MINI-LINK 6366/1 require additional handling when installed.

1.9 4+0 and 2+2 Compatibility

The ANT3 dual polarized antennas (HPX/SHPX)) can be used in integrated installation for the configuration 4+0 and 2x(1+1), this adding two IPS3 to the installation (same frequency as the antenna).

It is also possible for all dual polarized antennas (except 80 GHz) to install 4+0 and 2x(1+1) separated from the antenna, using two IPS2 and two Sep Kit RAU2 when using RAU2 or two IPS3 and two SepKit3 when using MINI-LINK 6363.

IPS2 or IPS3 Sym is used for the configuration 4+0 and 2x(1+1) working standby.
IPS2 or IPS3 Asym is used for the configuration 2x(1+1) hot standby

The antennas that can be used in integrated installation for 4+0 and 2x(1+1) are presented in Table 2. ANT3 C antennas requires that a stabilizing side strut is installed, Ant Side Strut C 4+0, NTB 101 0557/4.

The radiation pattern envelopes (RPEs) are typical and should be used for network planning. Guaranteed RPEs will not have any peaks exceeding the typical RPEs by more than 3 dB. In all cases peaks will not exceed the international standards listed in section 3.9.

The radiation pattern envelopes (RPEs) corresponding to the antenna versions in this document are specified in:
