# Boost your clinical confidence

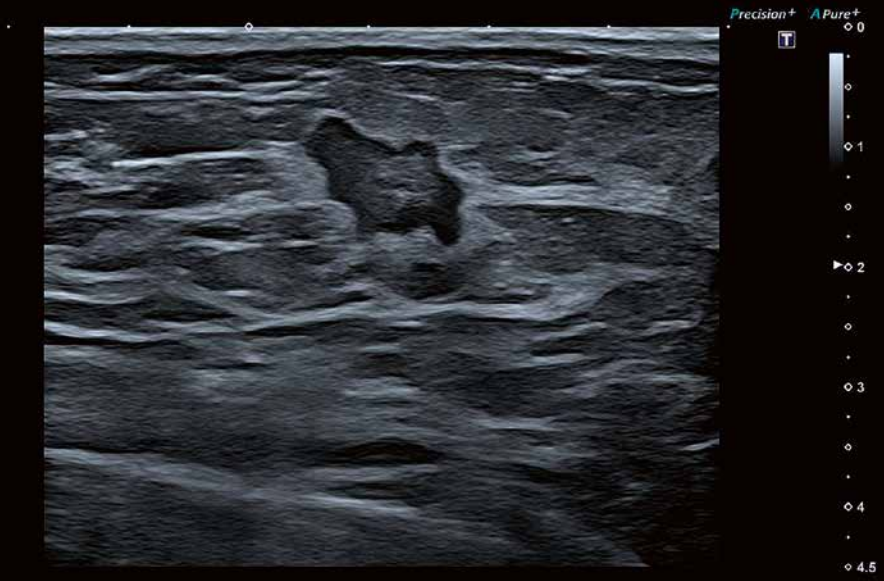
Aplio's powerful imaging technologies provide you with better image quality with reduced clutter, strengthened signal and improved visualization. The unique aBeam architecture provides the capability to ensure that all of Aplio's unique imaging technologies work together seamlessly for greater uniformity across all applications.

Precision+ offers outstandingly smooth images with sharpened outline of lesions, enhanced image uniformity and reduced clutter.

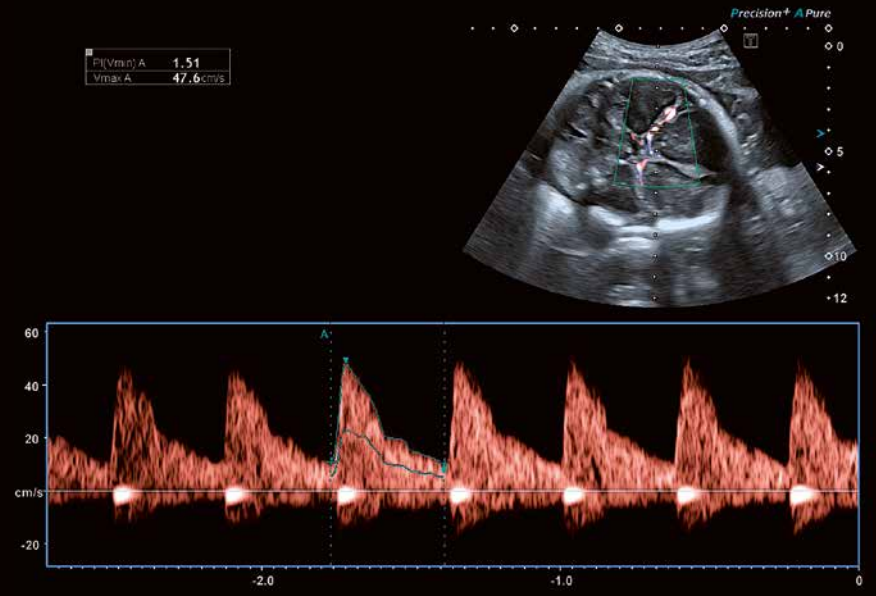
ApliPure+ compounding delivers increased imaging contrast and reduced speckle noise to improve visualization.

## Better diagnostics starts here

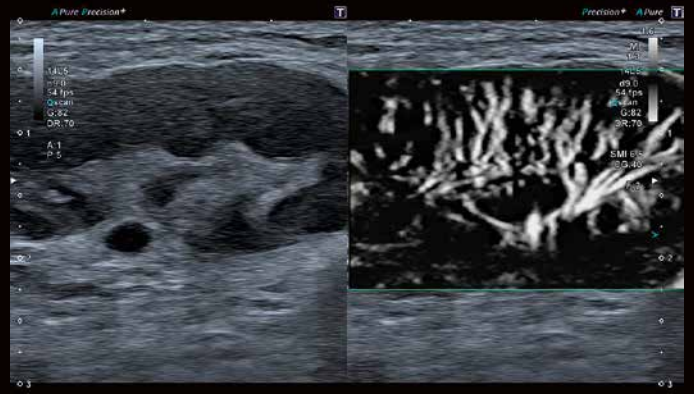
Designed to increase efficiency, the system's lightweight transducers feature outstanding clinical versatility, ergonomic shapes and thin, super-flexible cables. *Aplio a* is compatible with a wide range of transducers from across the Aplio product range, ensuring high productivity while helping reduce cost for specialty probes.



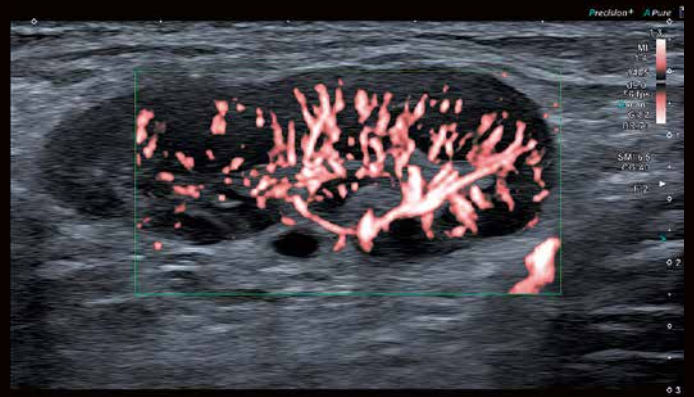
Differential Tissue Harmonics provides harmonic images of unsurpassed spatial resolution, alongside greatly enhanced penetration.



Aplio's wideband transducer and signal processing technology delivers outstanding sensitivity, penetration and spatial resolution for all Doppler modes.



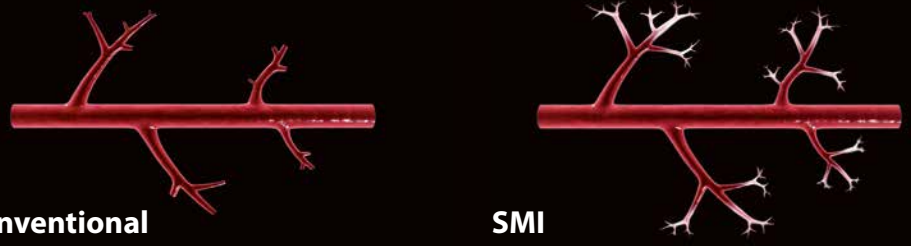
SMI's level of vascular visualization, combined with high frame rates, advances diagnostic confidence when evaluating lesions, cysts and tumors.



Color-coded SMI allows you to depict flow and greyscale information with high temporal and spatial information simultaneously.

# Seeing the unseen

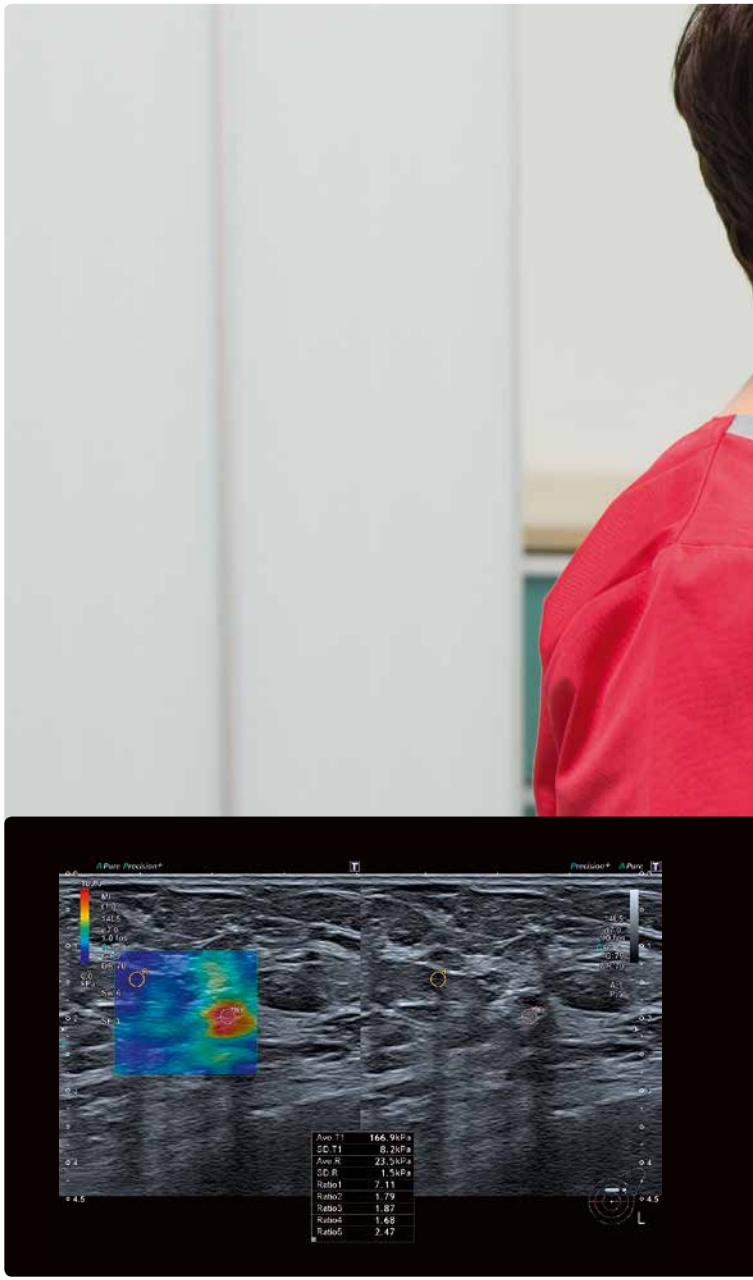
Experience color flow imaging with unmatched detail and definition on *Aplio a*. Superb Micro-vascular Imaging (SMI) expands the range of visible blood flow to a level of detail never before seen with diagnostic ultrasound. Exclusive iSMI now also allows you to image larger regions of interest without a reduction in frame rate.



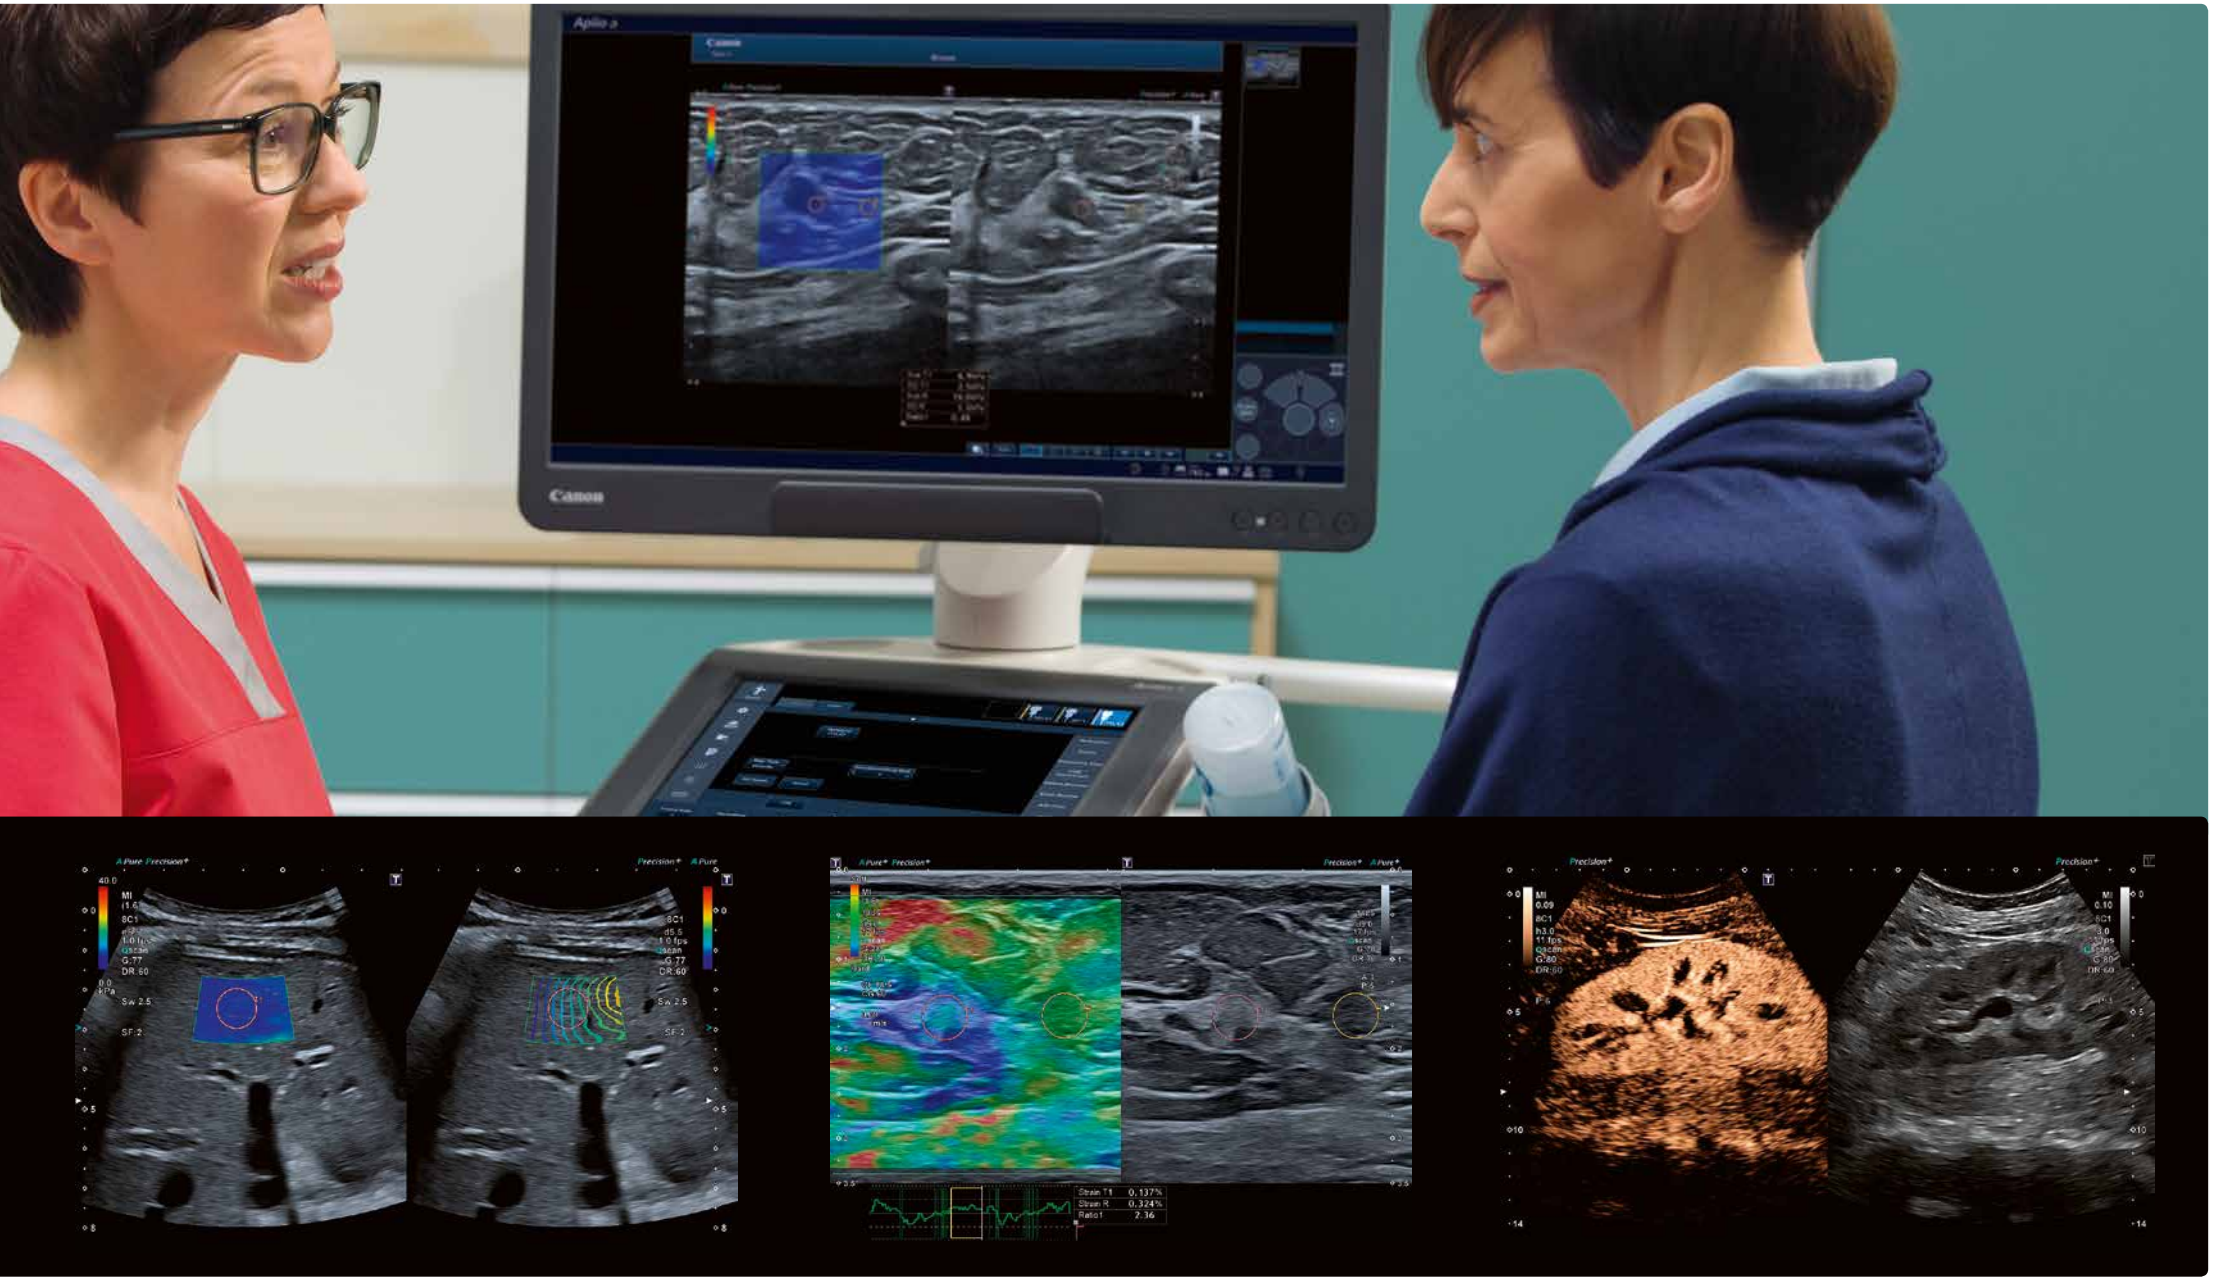
Traditional color Doppler imaging (left) removes clutter from the images by suppressing low-velocity components, resulting in a loss of flow in tiny vessels. SMI (right) separates flow from overlaying tissue motion effectively, while preserving even the subtlest low-flow components with unmatched detail and definition.

# Increase your confidence, expand your capability

Aplio's suite of advanced imaging and quantification functions provides the metrics to help you quickly diagnose with confidence. Combined with tools for early detection and reliable characterization of lesions it can help you optimize your patients' clinical pathway.



Canon Medical Systems' shear wave technology provides a quantitative measure and realtime display of tissue elasticity in a variety of clinical settings ranging from abdominal to small parts examinations.



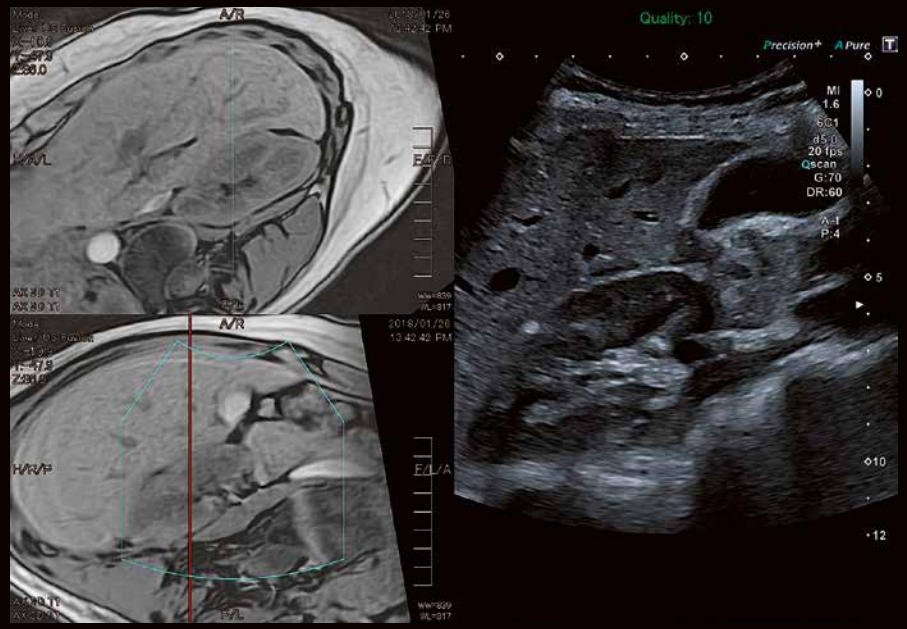
Smart Maps help you visualize and quantify shear wave propagation in realtime. Aplio's unique propagation map is a powerful and intuitive tool to visually assess the quality of an elastogram.

The system's comprehensive strain elastography suite with raw data functionality assists you in localizing and assessing palpable masses with high accuracy, sensitivity and reproducibility.

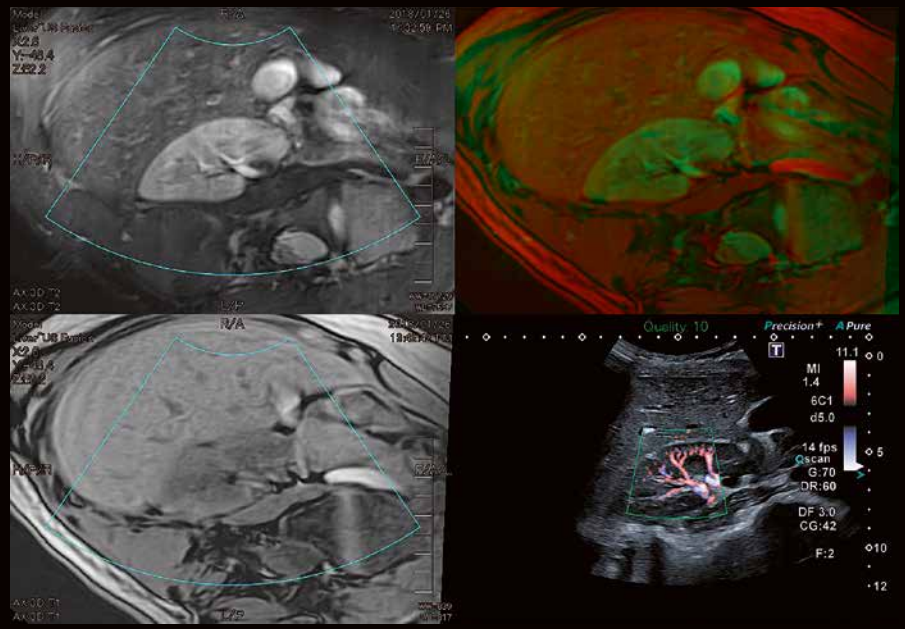
Aplio's comprehensive CEUS imaging and quantification package allows you to assess perfusion dynamics in a wide range of clinical settings, including an ample variety of specialized exams.

# Navigate with ease, treat with confidence

Aplio provides a wide range of tools for advanced imaging and interventions. Dedicated transducers and an abundance of imaging and navigation tools help you enhance confidence and accuracy during interventional procedures and their follow-up.

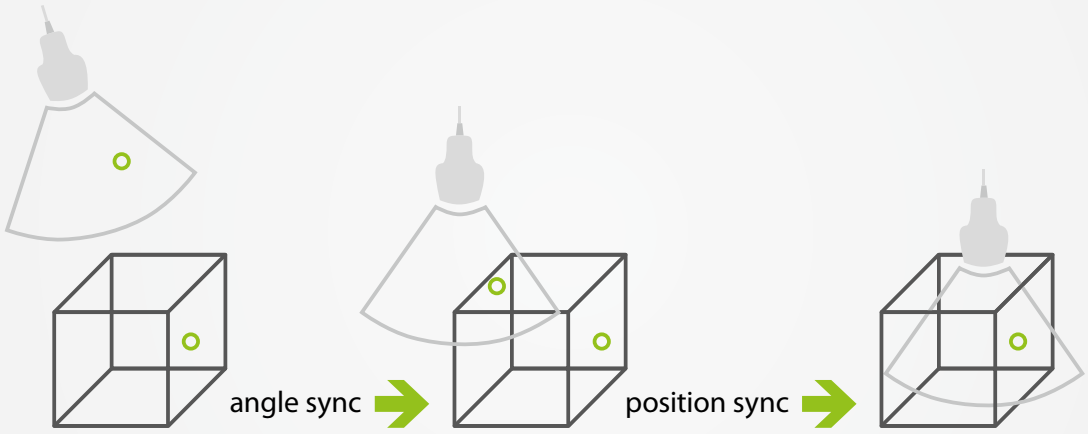


Smart Fusion merges realtime ultrasound with previously acquired CT, MR or ultrasound data, allowing you to identify and compare lesions with ease and to navigate complex anatomy confidently.



For comprehensive evaluation, Smart Fusion allows you to work in multiple imaging modes, including color Doppler and CEUS. The concise quad display shows the live ultrasound image in sync with multiple views of the pre-loaded data.

Aplio is compatible with a variety of needle guides with multi-angle or free angulation capability, either using brackets or directly mounted on the transducer to ensure easy handling with high precision and minimal blind zone.



## Merging modalities to improve visualization

On Aplio, merging two modalities for synchronized display is a simple and quick two-step process. Intelligent target and marker points facilitate navigation in the region of interest.

## Better intercostal access

Aplio's thin convex transducers are ideally suited for intercostal scanning. The new biopsy attachment with minimized blind area and selectable puncture angle facilitates optimal puncture conditions for each patient.

# Amazing detail, outstanding versatility

A wide range of standard and specialized ultra-wideband high-frequency transducers provide superior detail and definition in the near field for a wide range of examinations.

The ultra-high frequency transducers' outstanding resolution can help identify fine detail such as layered structures and small lesions.

The Panoramic Imaging and Smart 3D options provide simple yet effective ways to add field of view and volume imaging capabilities to the system without the need for additional hardware.

Advanced technologies such as elastography or SMI are also available on specialty transducers for advanced exams e.g. the quantitative assessment of inflammation in small joints.
