

# Debrisoft® Pad

## The gold standard for mechanical debridement.

### Fields of application

- Debridement of superficial, chronic and acute wounds and the skin surrounding the wound. In case of:
  - ◆ diabetic ulcers
  - ◆ arterial and venous ulcers
  - ◆ decubitus ulcers
  - ◆ postoperative wounds healing by secondary intention
  - ◆ traumatic or surgical wounds (e.g. abrasions, incisions, lacerations)
  - ◆ burns and scalds (3rd degree: following surgical debridement)
  - ◆ lymphoedema
- Suitable for dry, parchment-like, hyperkeratotic, seborrhoeic or oily healthy or damaged skin.

### Intended purpose

Debrisoft Pad is designed for fast, highly effective, safe and virtually painless debridement. Debrisoft Pad is used to absorb exudate, debris and skin keratoses during debridement and protects intact tissue.

### Properties

- angled fibre tips remove debris effectively from the wound and preserve already intact tissue
- the fibre composite also removes skin flakes and keratosis from skin surrounding the wound
- visible results quickly while being easy and safe to use
- soft fibres ensure virtually painless application, increasing patient acceptance

### Product composition

Composition: 100% polyester, unbleached  
 Back coating: 100% polyacrylic (without colophony and colophony derivatives)  
 Grip pocket: polyester, polyamide, elastane  
 Label: polyester

### To note

- product for debridement, does not stay on the wound
- can be used at every dressing change if needed
- should be used until the wound has been completely cleaned and the wound has transitioned from the inflammation phase to the granulation phase

### Advice

- very good results can also be achieved on hyperkeratotic or necrotic surfaces when they have been previously treated 'with autolytic debridement
- the soft fibre side can be moistened with any common wound irrigation solution

## Debrisoft® Pad

sterile, individually sealed

13 x 20	34323	5/50

# Suprasorb® P

## PU foam dressing

- A even distribution of wound exudate
- B perforated wound contact layer
- C impermeable to bacteria and water\*
- D permeable to water vapour

### Fields of application

- wounds with moderate levels of exudate
- superficial wounds
- non-infected wounds
- for all phases of wound healing, e.g.:
  - ◆ pressure and other ulcers
  - ◆ skin graft donor sites
  - ◆ surgical wounds
- Wound healing stages:
  - ◆ Exudation phase
  - ◆ Granulation phase
  - ◆ Epithelialisation phase

### Properties

- very good wound healing due to reliable exudate management
- high wearing comfort due to the soft, supple material structure
- The perforated wound contact layer prevents adhesion to the wound
- PU membrane repels bacteria and fluids
- maintains a moist wound healing environment and thereby assists the natural healing process
- the anatomical shape makes it easy to treat hard-to-reach areas such as the heel, elbow or amputation stumps\*\*

\* Suprasorb P non-adhesive

\*\* Suprasorb P Heel non-adhesive

### To note

Dressing change interval:

- To be determined by the attending physician in accordance with individual wound condition, degree of exsudate, and secondary dressing used, but no longer than 57 days. Change the dressing immediately when the wound edges begin to discolour.
- Suprasorb P can be used as a secondary dressing with wounds at risk of infection within the scope of a regular antimicrobial therapy regimen.
- When dry, Suprasorb P can easily be cut to the size of the individual wound. The dressing should overlap the wound edges by approx. 2 cm.

### Versions

- self-adhesive
- non-adhesive
- sacrum
- heel

## Soft nonwoven dressing pads

### Fields of application

- for treating wounds with low to moderate amounts of exudate
- as a wound dressing
- for wound cleansing
- as a carrier material for ointments
- as a padding material between fingers and toes

### Properties

- low-adherent
- soft
- absorbent

### Product composition

67% viscose, 33% polyester

# Mollelast®

## Elastic Conforming Bandage

### Fields of application

- for immobilisation of limbs
- for retention of dressings
- for compression with finger or toe lymphoedema bandages

### Properties

- lengthwise elastic (to about 100%)
- air-permeable and textured
- does virtually not crease when applied
- retains reliably even on tapered parts of the body and joints
- with selvedges
- white

### Product composition

56% viscose, 44% polyamide

# Mollelast® haft color

## Fields of application

- for immobilisation of limbs
- for retention of dressings and cannulas

## Properties

- lengthwise elastic
- widthwise elastic
- cohesive because of latex particles
- air-permeable
- is not very bulky
- the turns of the bandage stay reliably in place
- economical use of materials
- high-quality, stable selvages

## Product composition

Mollelast haft

66% viscose, 34% polyamide, coated with microfine natural rubber adhesive (latex)

Mollelast haft color

56% viscose, 44% polyamide, coated with microfine natural rubber adhesive (latex)

## Versions

- Mollelast haft: lengthwise elastic to about 65%/widthwise elastic to about 50%
- Mollelast haft color: lengthwise elastic to about 55%/widthwise elastic to about 50%

# tg<sup>®</sup> fix Tubular Net Bandage

### Fields of application

- For fixation of wound/ointment dressings

### Properties

- wide-mesh knitted fabric
- bi-elastic
- does virtually not crease when applied
- mesh-stable fabric prevents the tearing of the net
- can be cut individually

### Product composition

71% polyamide (crinkled), 29% non-brightened elastodiene (latex)

### Advice

- to inspect wounds or change dressings this product usually only has to be partially lifted up or the tube tucked up
- well suited for outpatient care
