

Product Description: LV and LH

ATLAS COPCO QUALITY AIR SOLUTIONS

General Description

In almost all applications, an air receiver tank is a necessary part of the compressed air system. The receiver acts as a reservoir of compressed air for peak demands and secures the compressor by not switching to often. In addition the receiver cools down the compressed air, which results in condensation and will secure the following equipment like dryers and filters.

All our receivers are galvanized to protect the vessel material and secure highest quality standards.

Our receivers are available in vertical (LV series) or horizontal (LH series) versions.

Scope of Supply

- Galvanized vessel
- Equipment kit with plugs, safety valve and manometer
