Atraumatic Surgical Needles

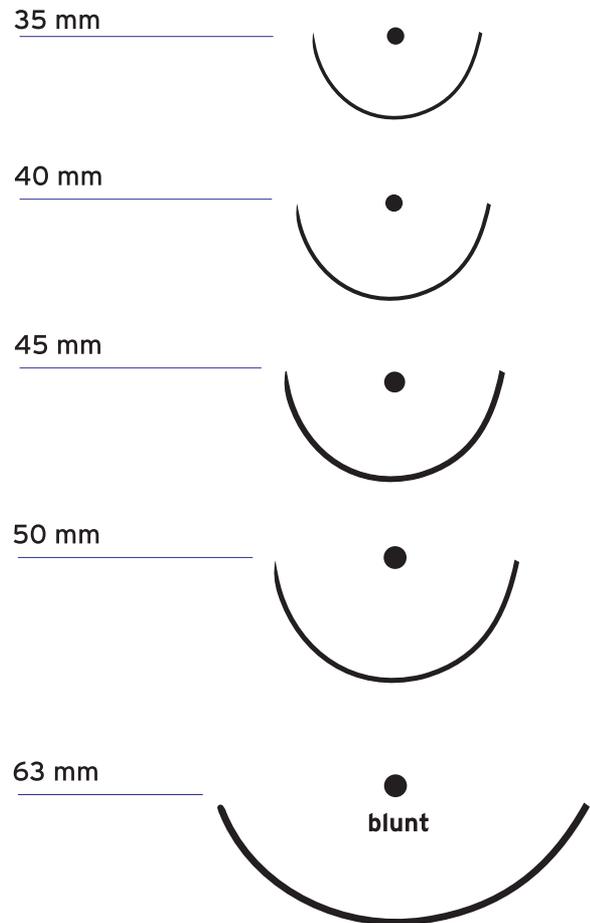

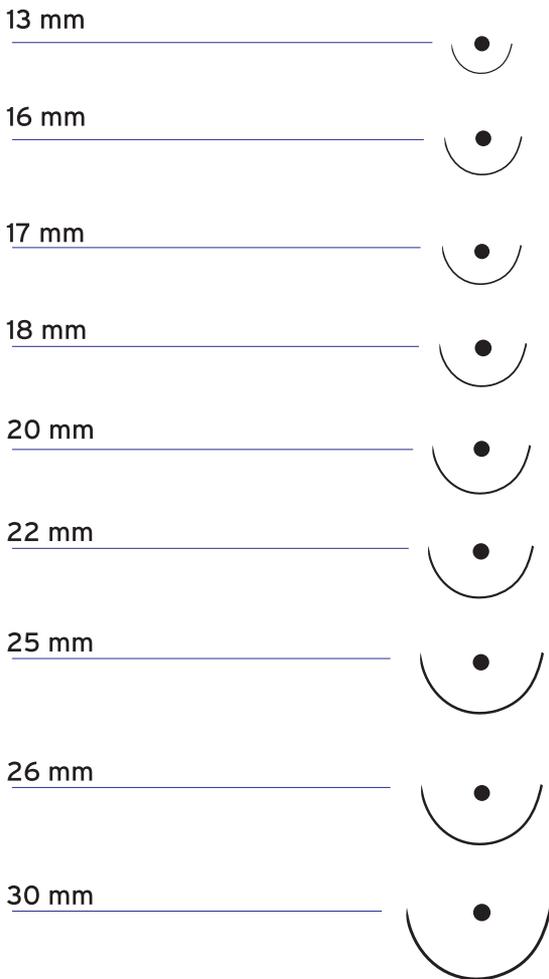

name	tip	body	symbol	description
round bodied			●	<ul style="list-style-type: none"> The most popular and classic needle type. Use in all soft tissue approximation including cardiovascular surgery.
cutting	inside 		▲	<ul style="list-style-type: none"> Edges are specially sharpened for an easy and smooth penetration. Cutting edge is inside the needle. Used in skin closures and in all applications requiring cutting needles.
	outside 		▼	<ul style="list-style-type: none"> Edges are specially sharpened for an easy and smooth penetration. Cutting edge is outside the needle. Widely used in skin closures and especially in plastic surgery.
PL			▼	<ul style="list-style-type: none"> Special geometry for easy penetration and high resistance to bending with a slim body. Widely used in plastic and cosmetic surgery and skin closures.
KD			Ⓨ	<ul style="list-style-type: none"> Specially designed for cardiovascular surgery for calcified vessels and tough fibrous tissues. The body is pressed to square shape to increase resistance to bending. Tip is specially sharpened for superior penetration.
diamond (taper cut)			◆	<ul style="list-style-type: none"> For better penetration and less tissue trauma, tip of the needle is sharpened. Widely used in cardiovascular/thoracic, orthopedic, obstetrics/gynecologic surgery and repairs of tendons and fibrous tissues.
black			●	<ul style="list-style-type: none"> Used where better visibility and prevention of reflection of the needle is required (eg when blood concentration is high) . Darkening of the metal is made by surface oxidation technique. Widely used in cardiovascular surgery.
			Ⓨ	
spatulated			▼	<ul style="list-style-type: none"> Both side edges and upper surface are cutting while the body is flattened. Widely used in ophthalmic surgery.
blunt point			●	<ul style="list-style-type: none"> The tip of the needle sharpness of round bodied is reduced. Uses include repair of liver and sensitive friable tissues.
