Head of Division

## 1 Introduction

On request of Profilsa Plastik Sanayi ve Ticaret A.S. represented by Ali Gürbag, BBRI carried out some tests in order to measure the tensile strength  $Q$ , the shear strength  $T$  and the elasticity constant  $c$  according to EN 14024 (2005). The results of these tests are given in the present report.

## 2 Description of the samples

The samples, aluminium window profiles, were delivered at BBRI Test Centre on 3 December 2018 under the registration number S2019-15-002. The composition and dimensions of the samples are given here below.

### 2.1 Composition of the samples

The schematic representation of the samples is shown in the different figures below.

*Figure 1: Cross view of the sample*

### 2.2 Dimensions of the samples

Length of the received profiles: 100 mm (cTQ)

### 2.3 Description of the samples

The description of the samples is given by the requestor

- Profile number: Not communicated
  - Thermal break: PA 24002, material PA66GF25, 2mm (thickness of cavities wall)
  - Surfacing: varnished after strutting

### 3 Description of the tests

#### 3.1 cTQ

The measurement of the T and Q values and the calculation of the c value for the profiles with thermal barrier are implemented according to the European standard NBN EN 14024 - version 2005.

According to the request, the following measurements should be done:

- Measurement of T and calculation of c
 

LT	<input checked="" type="checkbox"/>
RT	<input checked="" type="checkbox"/>
HT	<input checked="" type="checkbox"/>
Temperature category TC1	<input type="checkbox"/>

- Measurement of Q	LT	<input checked="" type="checkbox"/>
	RT	<input checked="" type="checkbox"/>
	HT	<input checked="" type="checkbox"/>
	TC2	<input checked="" type="checkbox"/>
- After ageing: measurement of T, c, Q, Δh, f, A<sub>2</sub> according to the ageing method
 

Method 1	<input checked="" type="checkbox"/>
Method 2	<input type="checkbox"/>
Method 3	<input type="checkbox"/>
- Performance after immersion in water (§ 5.2.2)
- Performance after exposure to humidity (§ 5.2.3)
- Testing for brittleness (§ 5.2.5)

With

LT : Lower temperature LT  
 RT : Room temperature  
 HT : High temperature HT  
 n : Quantity of sample  
 Δh : Residual deformation after ageing method 1  
 f : Residual deformation after ageing method 2  
 A<sub>2</sub> : Creep factor

#### Calculation of T<sub>c</sub> and Q<sub>c</sub>

On the measured values, the characteristic values are calculated according to the equation:

$$X_c = \text{AVG} - T_{0,05 p} \text{ STD}$$

with AVG : average  
 STD : standard deviation  
 n : quantity of sample

n	5	10
T <sub>0,05 p</sub>	2.375	2.02

## 4 Results of the tests

### 4.1 Profile (reference not disclosed, see picture)

#### 4.1.1 Type Varnished after strutting

The c values are calculated values.
