INTERNATIONAL STANDARDS AGRICULTURAL ROTOVATORS AND
SHREDDERS

Machine with an adjustable frame to lay down plastic films.

The process of covering the seedbeds with a plastic film, is considered today among the most functional and ecological passive methods for weed control. It has many advantages because it helps keeping the soil dry and crop safe by regulating the soil temperature, humidity, structure and microbial activity.

Mulch layers were developed exactly for this purpose: simplify and speed up the soil-covering process both with plastic or agricultural unwoven fabrics.

While machines are laying a mulch cover, they can also lay a drip hose and spread fertilizer.
