

Proximal Femur surgical technique

# Proximal Femur surgical technique

MUTARS® was developed in co-operation with Prof. Dr. W. Winkelmann (former director) and Prof. Dr. G. Gosheger (director), Clinic and Polyclinic for General Orthopedics and Tumororthopedics at the University Hospital of Münster, Germany.

MUTARS® has been in successful clinical use since 1992.

**Nota Bene:** The described surgical technique is the suggested treatment for the uncomplicated procedure. In the final analysis the preferred treatment is that which addresses the needs of the individual patient.

**Copyright note:** MUTARS®, implavit® and implatan® are registered trademarks of implantcast GmbH. The use and copy of the content of this brochure are only allowed with prior permit given by the implantcast GmbH.

\*E: Silver coated, TiN coated and cpTi/HA double coated components are not available in the US.

# MUTARS® Proximal Femur

#### The Silver coating

Infections represent the most severe complications of tumour arthroplastic treatments. Although local and systemic antibiotic treatments are considered, the scientific literature reports of infection rates from 5 to 35 percent [1]. Reasons for these high rates are, for example, the long surgery time, the large incisions and the immunosupression due to chemo therapy and radio therapy as well as the increasing resistance of the bacteria against antibiotic drugs.

Silver, in particular free silver ions, is well known for its broad-spectrum antimicrobial activity. The silver coating has been shown to reduce bacterial colonization on the device surface.

Until now only non-articulating surfaces and surfaces without direct bony contact are coated with silver. In the catalogue information of this surgical technique you can find the supplement \*S indicating which MUTARS® components are available in a silver coated version. The eight digit REF number receives an addition after the last digit (e.g. 5220-0020S).

#### Important intra-operative instructions for the use of silver-coated implants

It is not permitted to flush the wound with antiseptics that contain  $H_2O_2$ , Iodine or heavy metals (such as Betaisodona®) and acetic acid during surgery since this can lead to a subsequent loss of effectiveness of the silver coating due to their oxidative properties. Alternatively, solutions such as NaCl or Lavasept® and Prontosan® can be used. The additional use of antibiotic-containing bone cement can be an advantage particular in case of a septic revision.

#### The TiN coating for allergy prophylaxis

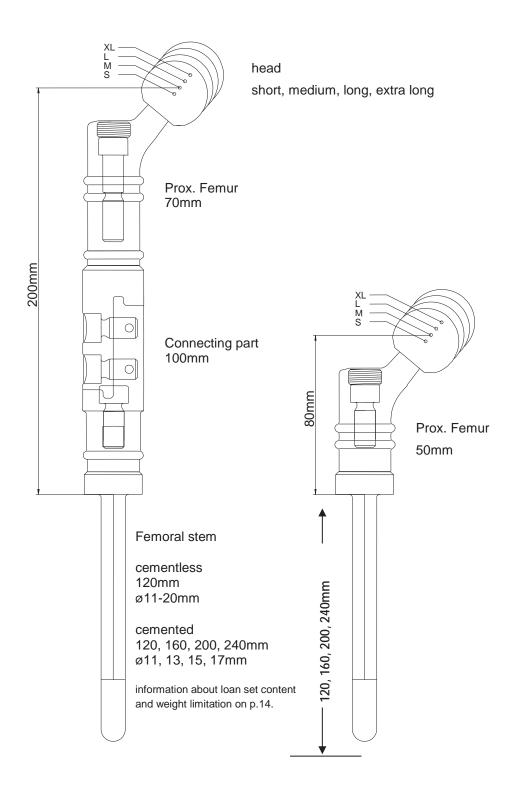

All metallic implant components release ions to their environment over time. In some patients such ions can elicit allergic reactions. Nickel, cobalt and chromium, which are elements of the base material CoCrMo of the articulating implant components, are considered the most frequently allergy eliciting metals [2] The TiN-coating is biocompatible and acts like a barrier; the potential release of allergy eliciting ions of the base material is reduced to a minimum [3]. Also in clinical practice there have never been any evidence of allergic reactions with implants that have been TiN-coated showing an intact surface [5]. Therefore the TiN-coating on implant components is especially suitable for patients with sensitivity to nickel, chromium or cobalt [4][5].

Since almost all components of the MUTARS® tumor system consist of titanium alloy, this only concerns those components, which are made of a cast CoCrMo alloy. The REF-numbers of the TiN-coated implants have the suffix N after the last digit (e.g. 5720-0005N). Items which are available with Silver and TiN coating have the suffix SN after the last digit (e.g. 5720-0005SN).

320mm	50	100	60 + 80	165 + 25
340mm	70	100	60 + 80	185 + 25

# For resection length 180mm and longer it is recommended to use the MUTARS® connecting part 100mm.

**Note:** Please notice that the amount of implants and instruments sent with an individual shipment may differ from the information in the catalogue information of this brochure. Please make sure, during the preoperatively planning, that all necessary implants and instruments are available for the surgery.

#### **Tumor resection**

Resect the tumour and measure the length of the explant. The minimum bone resection is 80 mm.

# Femoral bone preparation

Prepare the femoral medullary cavity with the MUTARS® medullary cavity reamer (fig. 1).

figure 1

Cementless fixation

Ream the femoral medullary cavity preferably up to a depth of 130mm with a flexible reamer 1,5mm smaller than the preoperatively chosen femoral stem (fig. 2).

#### Cemented fixation

Ream the femoral medullary cavity preferably up to a depth of 130mm with a flexible reamer 2mm larger than the preoperatively chosen femoral stem (fig. 2).

#### Remark

In case no flexible reamers are in the hospital's stock flexible reamers can be provided on special demand.

figure 2

# Rasping of the femoral cavity

Assemble the femur rasp of the appropriate size (see tables below), the sleeve and the slide hammer. Lock the rasp on the slide hammer by using the engineers' wrench.

#### Remark

The use of a femoral rasp for a **cemented stem** is optional. Generally you can proceed with the trial reduction (see page 6).

### Use of cementless stems

Use the femur rasp (fig. 3), of the same size as the preoperatively chosen femoral stem (table 1).

Stem size	Rasp size
12mm	12mm
13mm	13mm
14mm	14mm
15mm	15mm
16mm	16mm
17mm	17mm
18mm	18mm

table 1

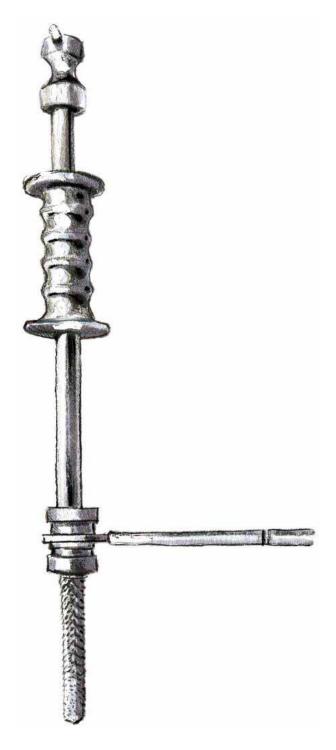

figure 3

figure 4a and 4b

Mark the anterior aspect of the femoral bone to meet the correct antecurvation of the femur (fig. 4a).

Rasp the medullary cavity with the chosen femoral rasp (fig. 4b). A carefully use of the slide hammer is recommended.

### Remark

It is recommended to clean the rasp of bone chips during the rasping.

Leave the femoral rasp in the bone for the trialing.

# Optional technique for the use of cemented stems

If you want to prepare for a cemented stem with the femoral rasp, please use the rasp which is <u>2mm larger</u> than the preoperatively chosen cemented femoral stem.

This will provide a cement mantle of 1mm thickness (table 2). Use the 18mm rasp to prepare for the 17mm stem.

Stem size	Rasp size
11mm	13mm
13mm	15mm
15mm	17mm
17mm	18mm

table 2

#### **Trial reduction**

Mount the Proximal trial femur and the possibly needed trial extension pieces (possible enlargement from 20 to 260mm; see table page 2) onto the top of the rasp (fig. 5a).

#### Remark

For the **cemented procedure** bone rasps are usually <u>not</u> available. Please insert the cemented stem (without cement) for trialing purposes (fig. 5b).

Insert a trial screw of the correct length (see table on page 2) (fig. 5a and 5b).

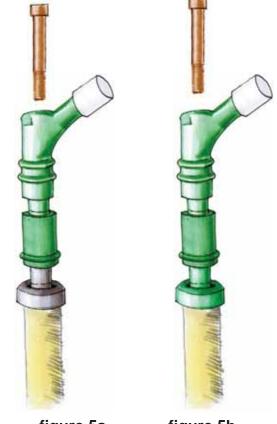

figure 5a

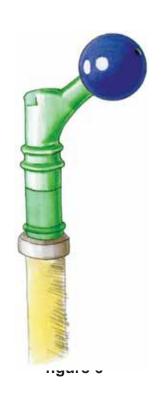

figure 5b

Place the medium trial head on the neck (fig. 6)

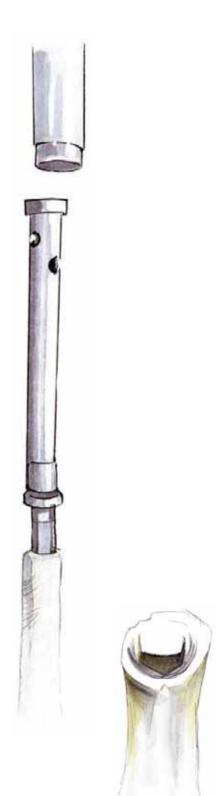

Do a trial reduction and check the muscle tension, the joint stability and the leg length.

Please check the rotational alignment. If necessary, adjust the rotation in steps of 5°.

Remove all trial components and the femoral rasp.

# Implantation of the femoral stem

Impact the femoral stem (fig. 7).

Insert the stem of the same size as the rasp if a **cementless stem** is used. To prevent fractures of the cortical bone it is helpful to fix a bone forceps around the femoral bone during impaction.

If a cemented implantation is planned, insert the intramedullary plug, the cement and insert a **cemented stem** which is <a href="mailto:2mm smaller">2mm smaller</a> than the previously used reamer or rasp.

Remove all instruments during the cement hardening to prevent bending moments.

figure 7

# Implantation of the proximal components

Combine the proximal implant components on the femoral stem. Insert the bar screw of the correct length (see table on page 2).

Tighten the bar screw with the socket wrench (fig. 8).

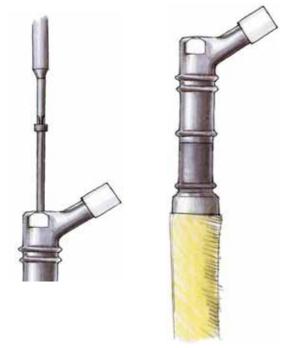

figure 8

# Final trialing

Once more, use the trial head to control the muscle tension (fig. 9).

Please check the rotational alignment. If necessary adjust the rotation in steps of 5°.

Remove the trial head when sufficient tension is achieved.

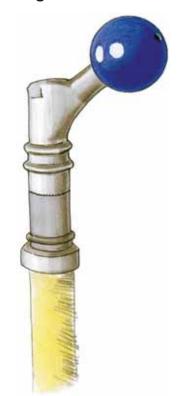

figure 9

figure 10

figure 11

# Final implant assembling

Lock the bar screw with the MUTARS® swing wrench (fig. 10).
Secure the assembly with the engineers' wrench (fig. 11).

Lock the safety screw in the same way.

### The use of the attachment tube

For soft tissue refixation to the implant, suitable mesh products available on the market can be used.

When a tube-formed mesh is used, cut a small portion of the mesh proximally, in order to allow visual contact to the acetabulum, once the mesh is fixed to the hip joint capsule. This facilitates joint reduction through the mesh.

Fix the mesh to the limbus / rest of the hip joint capsule first dorsally and then medially and laterally. The mesh needs to be folded outwards, towards the limbus / rest of the hip joint capsule (fig. 12). Use non-resorbable suture material.

Put the femoral head onto the proximal femur and reduce the joint (fig. 13). Fix the mesh to the rest of the capsule wall with sutures

When a flat mesh is used (not a tube), wrap it around the implant and suture the ends of the mesh to form a tube over the implant. Subsequently, tighten and fix the tube or the mesh above and below the retention rings of the MUTARS® components (fig. 14) to the implant. The mesh should be folded and turned up inward on the distal end of the implant.

Suture the muscles and tendon tissues to the mesh. (fig. 15)
