**Note:**

PASS: Indicates that the test is applicable.

N/A: Indicates that the test is not applicable.

### 1.3 Test Uncertainty

**Radiated Disturbance: $\pm 2.2\text{dB}$**

**Conducted Disturbance: $\pm 1.8\text{dB}$**

## 2 General Information

### 2.1 Client Information

Applicant : Guangzhou Micron Vending Technology Co., Ltd.  
Address : No.1, Tiantai 1st Road, Huangpu District, Guangzhou, Guangdong, China

Manufacturer : Guangzhou Micron Vending Technology Co., Ltd.  
Address : No.1, Tiantai 1st Road, Huangpu District, Guangzhou, Guangdong, China

### 2.2 Detail of EUT

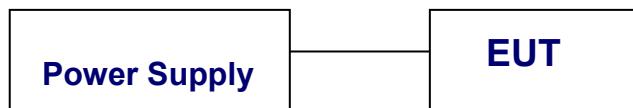

Product : Vending Machine  
Model No. : WM800  
Technical : 220-240V~, 50/60Hz, 230W, Class I

### 2.3 Principle of Configuration Selection

**Emission Test:** The equipment under test (EUT) was configured to measure its highest possible radiation level. The test modes were adapted accordingly in reference to the Operating Instructions.

**Immunity Test:** The equipment under test (EUT) was configured to the representative operating mode and conditions.

### 2.4 Block Diagram of EUT Configuration during the Test

### 2.5 Test Instruction

All the tests were performed in the condition of 240V input on model WM800.

## 2.6 Classification of EUT

- Category I** : Apparatus containing no electronic control circuitry
- Category II** : Apparatus containing electronic control circuitry with no internal clock frequency or oscillator frequency higher than 15 MHz
- Category III** : Apparatus battery powered apparatus, which in normal use is not connected to the mains, containing an electronic control circuitry with no internal clock frequency or oscillator frequency higher than 15 MHz
- Category IV** : All other apparatus

Due to the oscillator frequency of EUT lower than 15MHz, According to EN 55014-2 EUT to belong to Category II device, so the Radio-Frequency Electromagnetic Field test not apply.

## 4 Conducted Disturbance Test

### 4.1 Test Standard

EN IEC 55014-1:2021

### 4.2 Diagram Test Setup

### 4.3 Test Equipment's Used

Refer to see section 3.

### 4.4 Test Description

#### 4.4.1 Equipment Test Setup

EMI Test Receiver Setting:

Detector: Quasi-Peak and Average

Band Width: 9 KHz

Frequency Range: 150 KHz to 30MHz

#### 4.4.2 EUT Operation

Turn on the EUT.  
Let the EUT work in normal operation mode.

#### 4.5 Test Procedure

During the test the EUT was placed on a non-conductive table which is 0.8 meter above the grounded reference plane. Connected the power line of the LISN and connected the receiver to LISN by coaxial line. Detected the disturbance signals of the live line and neutral line.

#### 4.6 Conducted Disturbance Limit

Frequency Range MHz	Limits(dBuV)	
	Quasi-Peak	Average
0.15 to 0.5	66 to 56	59 to 46
0.5 to 5	56	46
5 to 30	60	50

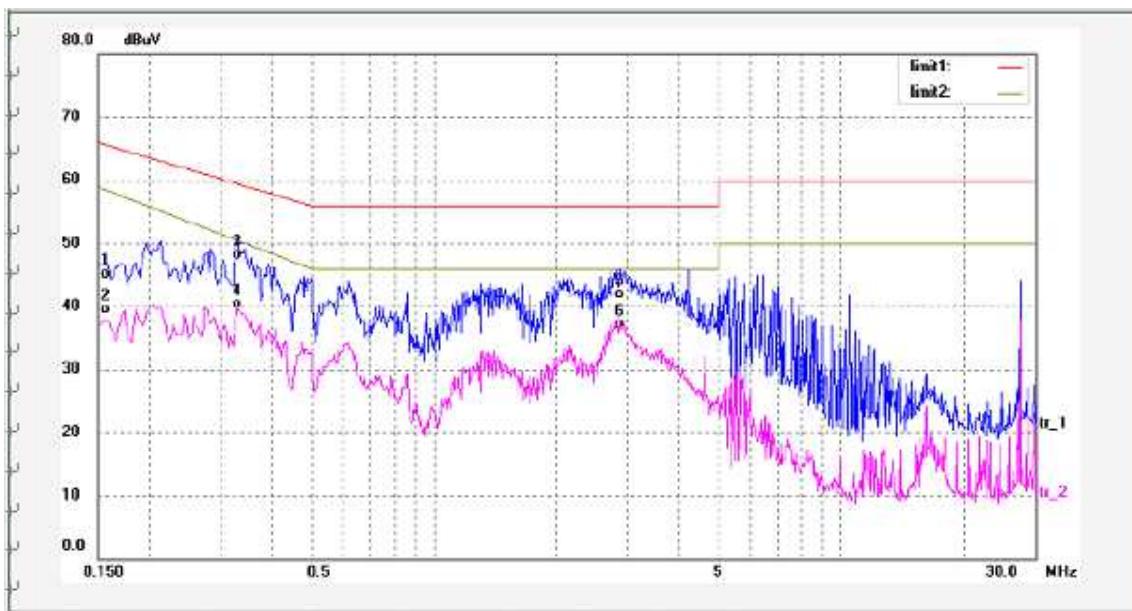

NOTE 1 The lower limit shall apply at the transition frequencies.  
NOTE 2 The limit decreases linearly with the logarithm of the frequency in the range 0,15 MHz to 0,50 MHz.

#### 4.7 Test Result and Test Data

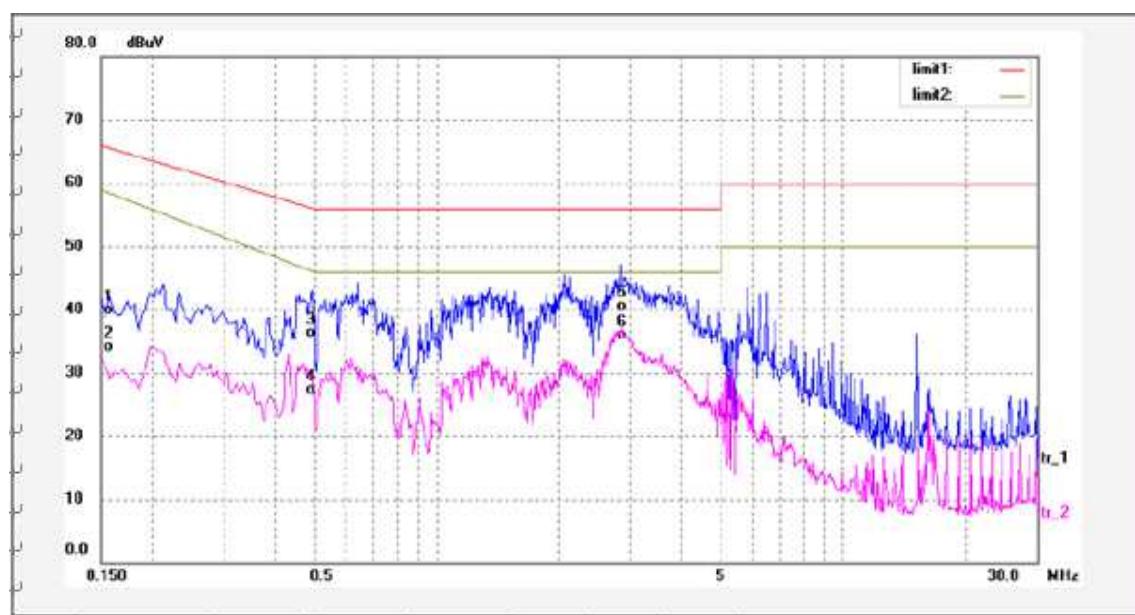

**Test Result: PASS**

**Test Data:**

Test data refer to see following pages.

**Live Line:**

## 5 Disturbance Power Test

### 5.1 Test Standard

EN 55014-1:2017+A11:2020

### 5.2 Diagram Test Setup

### 5.3 Test Equipment's Used

Refer to see section 3.

### 5.4 Test Description

#### 5.4.1 Equipment Test Setup

Detector: Quasi-Peak and Average

Band Width: 120 KHz

Frequency Range: 30MHz to 300MHz

Clamp slide: 0 to 6 m

#### 5.4.2 EUT Operation

The operation mode of EUT is same as Section 3.4.2.

### 5.5 Test Procedure

The EUT is placed on the table which is high 0.8m by insulating support and away from other metallic surface at least 0.8m. It is connected to the power mains through an extension cord of 6m minimums. The absorber clamp was clamps the cord and moves from the far end to EUT to measure the disturbing energy emitted from the cord.

### 5.6 Radiated Disturbance Limit

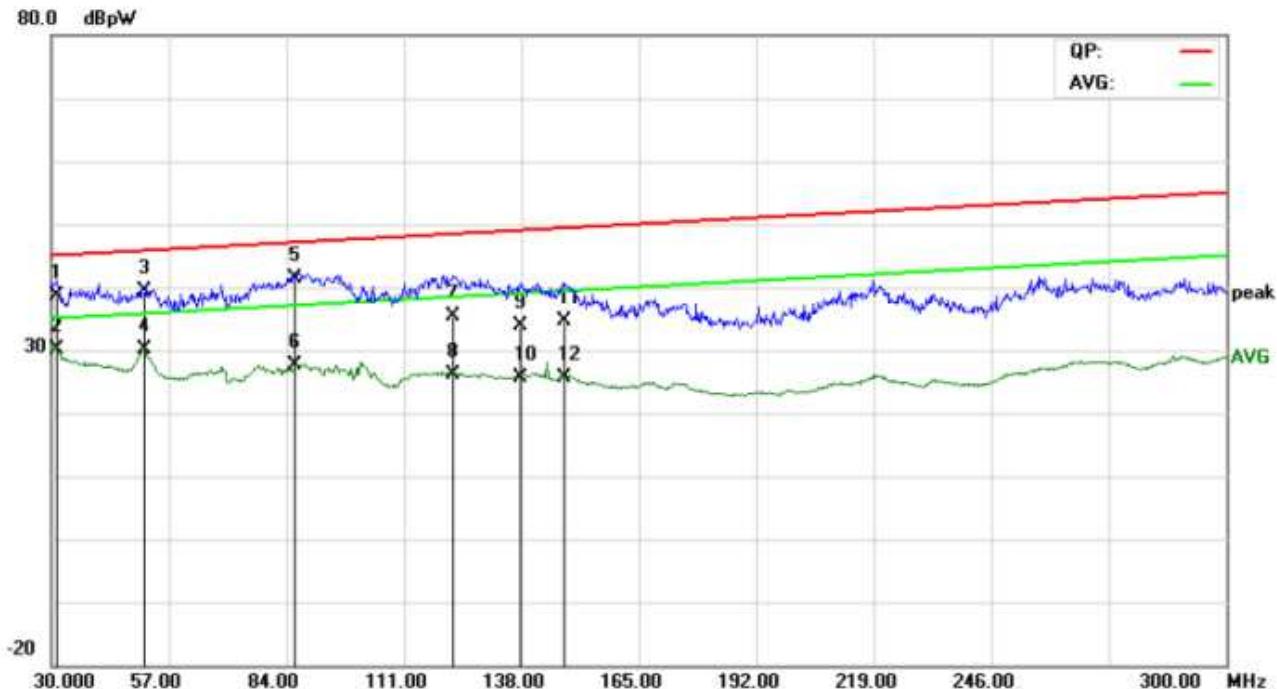

Frequency Range MHz	Limits(dBpW)	
	Quasi-Peak	Average
30 to 300	45 to 55	35 to 45
NOTE 2 The limit decreases linearly with the logarithm of the frequency in the range 30 MHz to 300 MHz		

### 5.7 Test Result and Test Data

**Test Result: PASS**

**Test Data:**

Test data refer to see following pages.

**Remark:**

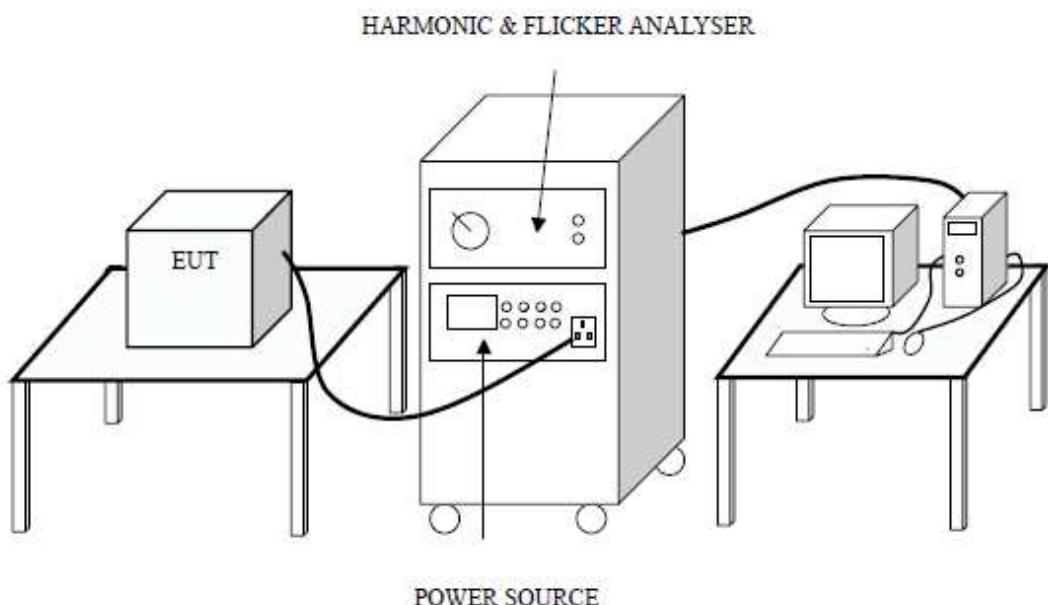

1. Corr. Factor (dB) = Clamp Factor (dB) + Cable Loss (dB)
2. Margin (dB) = QuasiPeak/Average (dB<sub>pW</sub>) - Limit (dB<sub>pW</sub>)

## 6 Harmonic Current Emissions on AC Mains

## 8.5 Test Description

### 8.5.1 EUT Operation

The operation mode of EUT is same as Section 3.4.2.

### 8.5.2 Test Procedure

#### Air Discharge:

- This test is done on non-conductive surfaces. The round discharge tip of the Electrostatic Discharge simulator shall be approached as fast as possible then to touch the EUT. After each discharge, the simulator shall be removed from the EUT. The simulator is then re-triggered for a new single discharge and repeated 10 times for each pre-selected test point. This procedure shall be repeated until all the air discharge completed.

#### Contact Discharge:

- All the procedure shall be same as air discharge, except using the acute discharge tip. The top end of the Electrostatic Discharge simulator is touch the EUT all the time when the simulator is re-triggered for a new single discharge and repeated 10 times for each pre-selected test point.

#### Indirect Discharge:

- The vertical coupling plane (VCP) is placed 0.1m away from EUT. The top end of Electrostatic Discharge simulator should aim at the center of one border of the VCP for at least 10 times discharge.
- The top end of Electrostatic Discharge simulator should place at the point 0.1m away from EUT on the horizontal coupling plane (HCP). At least 10 times discharge should be done for every pre-selected point around EUT.

Recording any performance degradation of the EUT during the test and judge the test result according to performance criterion.

## 9.5 Test Description

### 9.5.1 EUT Operation

The operation mode of EUT is same as Section 3.4.2.

### 9.5.2 Test Procedure

For AC power input ports:

EUT is connected to coupling/decoupling network which couples the EFT signal to power input lines. During the test, both polarities of the test voltage should be applied and the duration of the test can't be less than 1mins.

For signal / control lines and DC power lines:

The cables of EUT no longer than 3 m, shall not be tested.

EUT and its simulators shall be placed 0.8m high above the ground reference plane which is a minimum 1m\*1m with minimum 0.65mm thickness. This reference ground plane shall project beyond the EUT by at least 0.1m on all sides and the minimum distance between EUT and all other conductive structure, except the ground plane beneath the EUT, shall be more than 0.5m.

Recording any performance degradation of the EUT during the test and judge the test result according to performance criterion.

## 10.5 Test Description

### 10.5.1 EUT Operation

The operation mode of EUT is same as Section 3.4.2.

### 10.5.2 Test Procedure

In this test, the 1.2/50us& 8/20us surge generator must be used for AC power ports. The voltage for line to earth coupling mode is twice of that for line to line. At least 5 positive and 5 negative (polarity) surge signal with a maximum 1/min repetition rate are injected to AC power lines from 4 different phase angle( 0°,90°,180°,270) during the test.

Recording any performance degradation of the EUT during the test and judge the test result according to performance criterion.

## 11.5 Test Description

### 11.5.1 EUT Operation

The operation mode of EUT is same as Section 3.4.2.

### 11.5.2 Test Procedure

Scanning Frequency: 150 KHz -- 80 MHz

Radiated Signal: 80% amplitude modulated with a 1 KHz sine wave.

Step Size: 1% of the start and thereafter 1% of the preceding frequency value.

Test specifications: 150 Ω source impedance.

EUT is placed on an insulating support of 0.1m high above a ground reference plane. It must be 0.3m away the CDN (coupling and decoupling network) of which the bottom is made of metallic material and placed directly on the ground plane. Cables between CDN and EUT are as short as possible, and their height above the ground reference plane shall be between 30 and 50 mm (where possible). The disturbance signal amplified by amplifier is injected to EUT through CDN.

Recording any performance degradation of the EUT during the test and judge the test result according to performance criterion.
