DUZEY MESH
MESH FOR HERNIA REPAIR

DUZEY POLYPROPYLENE MESH

Primary choice for hernia treatment is surgical operation. Also prothesis materials are considered among surgical options. When sufficient amounts of healthy tissue cannot be found or the defect is larger; it is the primary option to apply prothesis materials. Our product, polypropylene mesh is the tissue prothesis, which is used instead of tissue supplement exactly at this point. Duzey mesh is manufactured from polymer monofilament fiber, compliant to production principles of medical sutures. Duzey Mesh has a high tension and displosion resistance between thickness values of 0,30 mm and 0,60 mm. Duzey mesh enables cutting the mesh without the necessity of removal; as well as provides inner connection between each monofilament fiber and dual flexibility.

- * Accelerates tissue healing thanks to its braided texture.
- * Sterilized with EO
- * Biologically compliant.
- * Flexible, robust and lucid.
- * Provides ideal pore interval for tissue healing.
- * High power and displosion resistance for sustainable support.

Special production can be made in the desired thickness upon request.
