UROLOGY

Ureteral Stent

Ureteral Stent

Overview

Ureteral Stent Sets Ureteral Stent is an internal drainage stent that consists of double loops forming in opposite directions, with the proximal loop forming in the renal pelvis and the distal loop forming in the bladder.

The Ureteral stents come with the following accessories that aid device placement:

- Ureteral Stent reopening clamp; and
- Simple pusher
- Coaxial pusher

The Ureteral stent is composed of polyurethane material and designed with drainage holes that are located on the proximal and distal loops and also on the stent shaft. The stents are available in diameters of 3 Fr to 8 Fr with working lengths ranged from 12 cm to 30 cm.

The stent is radiopaque throughout its length.

The device is supplied Non coated or hydrophilic coated, and also may supplied with suture:

The distal end and shaft of the ureteral stent has a hydrophilic coating.

A suture is looped through the most proximal drainage hole which allows for stent adjustment or removal during placement. Right after positioning of the ureteral stent, the suture has to be removed (i.e. once placement is complete).

Multi-lengths Ureteral Stents have multi-loops for both loop ends, which give flexible lengths for the physician during the application of the stent, the working length of the stent is 22cm

The Device is Sterile, E.O. Gas Sterilization and is a single use
