BALL-JOINT FIXATORS

The Dynamic Multi Axial Fixator (DAF) is designed to allow the transmission of the axial forces over the frame during the healing. In this way, the increasing loads that could effect the fracture are transferred. This feature is obtained by creating a fixator body in two parts.

DAF has a nested telescopic structural body and additionally a unit that can compress or distract.

After the application, the Central Body Locking Nut is tightened to lock the pieces of the body for creating a stable single unit. This process continues until the dynamization of the fracture.

The dynamization must be done after detecting the presence of a Callus, in this way natural forces work for the union of the fracture. Callus is mostly seen at the fifth week after the application.

Dynamization technique is a gradual loading process to the fracture line for the closure of the fracture gap.

When the DC unit is turned 360° (a full turn) it enables for 2 mm to shorten or extend. An allen wrench is also useful to turn the compression-distraction unit.

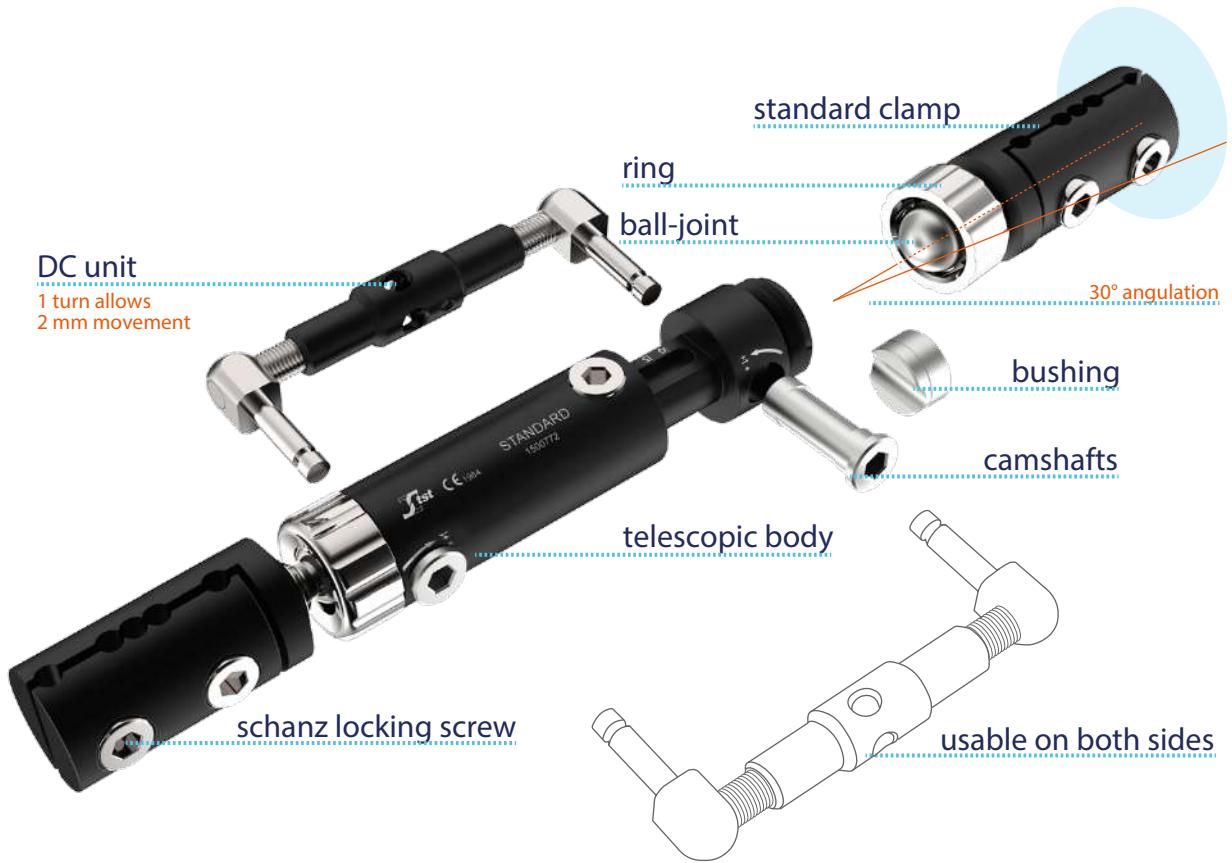

The measure of the movement at the fracture site is dependent to the callus and soft tissue resistance and the system rigidity. If a gradually increased loading is desired at the fracture site, the central body locking nut should be loosened.

Ball-jointed Fixators are primarily used in acute trauma cases. The Ball-joint structure allows the final positioning of the bone fragments after the application of the fixator. If needed, in some fixator application that bridges the joint, the fixator allows the joint mobilization.

The ball-joint designs of the TST Fixator products are not the same. But all of them are based on the Camshaft-Bushing system and when the system is squeezed, the positions of the bone screws are fixed.

The Fixators in this section are; Dynamic Multiaxial Femur-Tibia Fixators, Dynamic Multiaxial Humerus Fixators, Dynamic Angled Wrist Fixators, Pelvis External Fixators, Segmental Multiaxial Bone Transport Fixators.

The fixator body consists of a Telescopic Body, Central Body Locking Bolt, camshafts on the both hands and bushings which used for the clamps locking.

By loosening the central body locking bolt, the nested telescopic structure can provide compression or distraction with the axial loading.

There is a scale on the telescopic body for the follow-up of the compression and distraction.

The groove side of the bushing is placed facing the camshaft into the body.

The camshaft is turned to the lazer marked direction to lock or to loose with a 6 mm Allen key.

Versatility of the fixator allows simple angular adjustment. Because of the spherical structure of the ball-joint, the clamp can move 30° in all directions when the camshaft bushing system is loosened.

After loosening the clamp, schanz screws can be applied directly through these slots or guides for drill and Schanz screws can be applied, too. Therefore, the additional use of a template is not necessary.

For separating the clamp from the fixator body, the metal ring at the connecting part is removed and following that other suitable clamps can be attached.

A full turn of the Distraction-Compression Unit (DC Unit) provides 2 mm compression or distraction. It turns with help of allen wrench.

DAF DYNAMIC MULTIAXIAL FIXATOR

It is a single plan external fixation tool.

The ball-joint structure connects the clamp to the fixator body as an articular structure and allows the final reduction after the implantation of the fixator.

The Fixators Schanz screw holder clamps have five slots for the schanz screws. The usage of a template is not obligatory.

The indications for the fixator are; long bone fracture, intra-articular, periarticular fractures and pelvis fractures.

It is essentially used in acute trauma cases.

In some cases if it is needed, it allows joint mobilization.

The system allows correction of postoperative reduction.

Fixators versatility allows simple angular adjustments.

It provides an opportunity to move 30° in all planes.

A full turn of the DC unit allows 2 mm movement.

DAF T CLAMP

T-Clamp ensures to send schanz screws in a uniplaner configuration to epiphyseal and metaphyseal region.

The design of T-Clamp enables to send 5 schanz screws horizontally to the metaphyseal region of the bone.

It is used for distal/proximal femur and distal/proximal tibia intra-articular besides for periarticular fractures that have enough space for Schanz screw applications.

The clamp provides 30° movements in all directions.

135° CLAMP DAF

The holes of schanz screws are angled to 135° to the long axis of the clamp.

It allows to send Schanz screws to the femur head through the femoral neck when the fixator body is positioned parallelly to the long axis of femur.

It is used in the treatment of trochanteric, subtrochanteric and wide femoral shaft fractures.

PILON FIXATOR

It is used for the treatment of distal tibial and pilon fractures.

Based on the module at the distal of the fixator, schanz screws can be placed into the talus and calcaneus.

In case of need, this module also allows to controlled dorsiflexion and plantar flexion motion.

C-Clamp (Articulating Pilon Multiaxial Fixator) and Straight are the two different types of Pilon Fixator.

ARTICULATING PILON MULTIAXIAL FIXATOR

Used for the treatment of distal tibia and pilon fractures.

Schanz screws can be placed into talus and calcaneus with the C-Clamp.

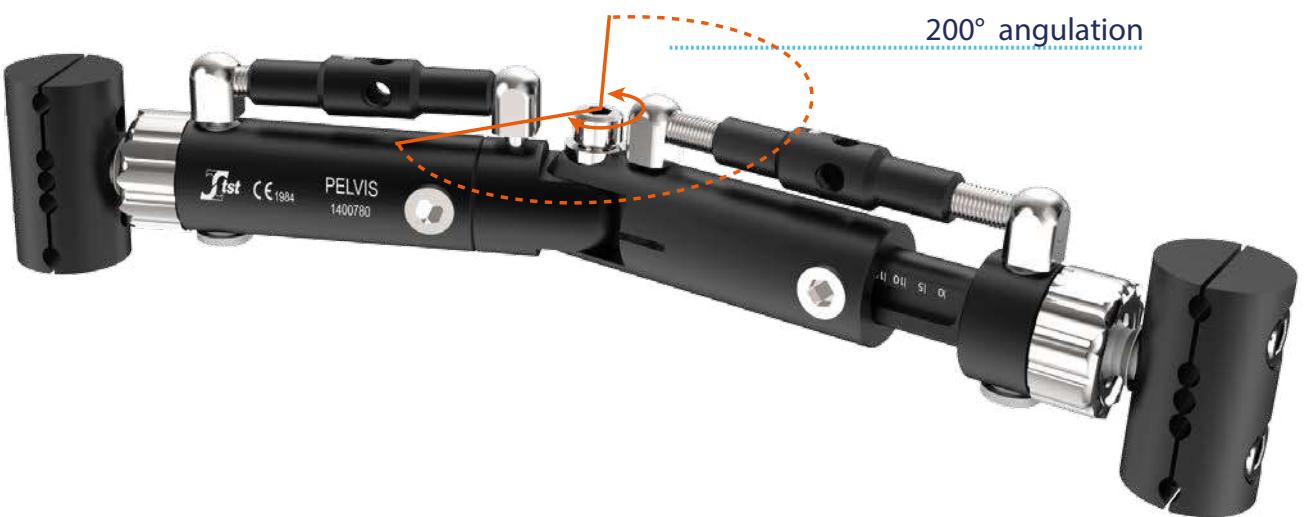

If required, this module also allows to controlled dorsiflexion and plantar flexion motion.

The C-clamp allows a clear imaging of the fracture area.

DOUBLE CLAMP

Used for the connection of two different or the same external fixator via the ball-joint structures.

For instance, it can be used in the central hip dislocation cases by applying schanz screws to the pelvis and the femur.

DESCRIPTION
DOUBLE CLAMP

TYPE
DOUBLE

DC UNIT (Distraction Compresion)

The unit is designed to compress or distract the fracture area.

It is composed of one inside threaded cylindrical structure and two legs with threaded rods which are placed into the holes of the camshaft.

By turning the unit with allen wrench, the unit shortens or extends according to the turning direction.

When the DC unit is turned 360° (a full turn) it enables for 2 mm to shorten or extend.

The legs of the unit are placed into the camshafts which are on the fixator and the fixator body locking screw is loosened.

The DC Unit is used for compression of the nonunion fracture area or fracture impaction and gradual correction of the deformities.

In addition, this unit is used together with the LRS system for bone transport or lengthening.

DC Unit has 3 different choices as short, standard and long.

HYBRID CLAMP

It allows to connect DAF system to Circular External Fixator rings.

CODE 40140020300 **BARCODE** 8698673452114 **DESCRIPTION** HIBRID CONNECTION CLAMP

TEMPLATE

It is a template fixator with the same shape as the fixator. It is an assisting instrument that provides the correct placement of the schanz screws. After placing the first schanz screw, the rest schanz screws send through the slots of the template fixator. It helps to find the suitable position over the bone to fix the fracture.

It is used for positioning the fixator for allowing the dynamization (shortening). Because of that the fixator can not placed at the shortest form.

CODE 03540000000 **BARCODE** 8680858419302 **DESCRIPTION** FEMUR-TIBIA DYNAMIC MULTIAXIAL FIXATOR TEMPLATE

MANIPULATION FORCEPS

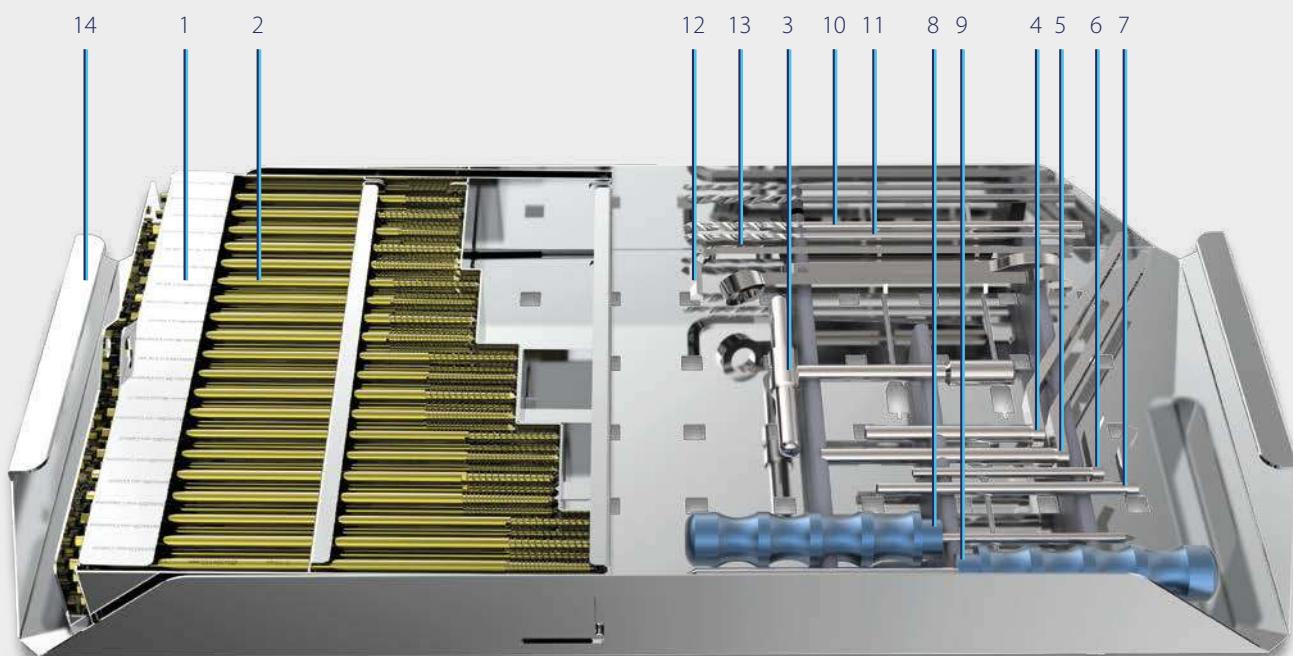

The manipulation forceps which is optional, can be used for fracture reduction. By holding two clamps with these forceps, the manipulation force and control becomes easier. The surgeon's assistant can fix the fixator system, after providing the reduction of the fracture by the surgeon.

DAF
HUMERUS

WRISTX

DAF HUMERUS FIXATOR

It is a single plan external fixation tool and used for the treatment of the fractures of humerus, radius and ulna for adults.

It is also used at pediatric femur, tibia fractures and deformity corrections.

The ball-joint structure connects the clamp to the fixator body as an articular structure and allows the final reduction after the implantation of the fixator.

The Fixators Schanz screw holder clamps have five slots for the Schanz screws.

It is primarily used in acute trauma cases.

In some cases if it is needed, it allows joint mobilization.

The system allows correction of postoperative reduction.

Fixators versatility allows simple angular adjustments. It provides an opportunity to move 30° in all planes.

A full turn of the DC unit allows 1 mm movement.

40840020101	8698673456518	DYN. MULTIAXIAL HUM. FIX.	LONG	200	47

DAF HUMERUS WITH T CLAMP FIXATOR

T-clamp with the ball-joint structure could be used instead of the straight clamp at the dynamic multiaxial fixator.

T-Clamp gives the opportunity to place the Schanz screws in an uniplaner configuration to epiphyseal and metaphyseal region.

It has a design that 5 screws could be applied horizontally to the metaphyseal region of the bone.

It is used for distal/proximal femur and distal/proximal tibia intra-articular and periarticular fractures which have enough space for Schanz screw applications.

DAF HUMERUS WITH 135° CLAMP FIXATOR

It has Schanz screw holes opened in a 135 ° angle to the long axis of the clamp.

It allows to the placement of the Schanz screws to the humerus head when the fixator body is positioned parallel to the long axis of humerus.

The 135 ° clamp has four screw holes.

DYNAMIC ANGLED CLAMP WRIST FIXATOR

Lightweight and low profile structured fixator.

Owing to the double ball-joint structure, it provides an easy reduction.

The ball joint structure can be tightened and / or loosened with a 4.0 mm L-Allen key.

Suitable for extra-articular or transarticular external fixation technique.

The ball-joint structure can be loosened at the transarticular application if there is a need of a Hand-wrist mobilization.

It is used in the treatment of joint stiffness, articular and periarticular fractures of distal radius and deformity corrections.

It is used with 3-4 mm Schanz screws.

CODE	BARCODE	DESCRIPTION	TYPE	LENGTH (mm)
40640030103	8698673456570	DYNAMIC ANGLED CLAMP WRIST FIXATOR	SHORT	170

40640010101	8698673456563	DYNAMIC ANGLED CLAMP WRIST FIXATOR	LONG	230

MULTIAXIAL DISTAL RADIUS WRIST FIXATOR

Another type of fixator for the hand-wrist application is the “Multiaxial Distal Radius Hand-Wrist fixator”.

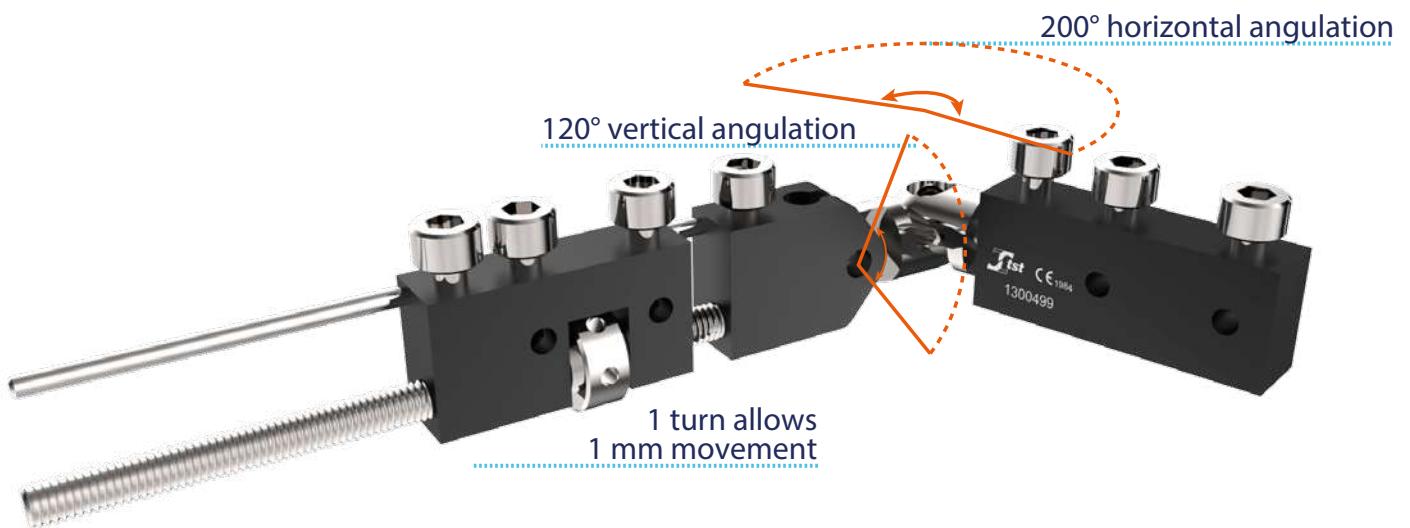

It is composed of a central located C shaped body and bars which are connected with the ball-joint structure. Pin clamps can move on the bars for compression or distraction.

The C body of the fixator allows to view the fracture area.

SURGICAL TECHNIQUE

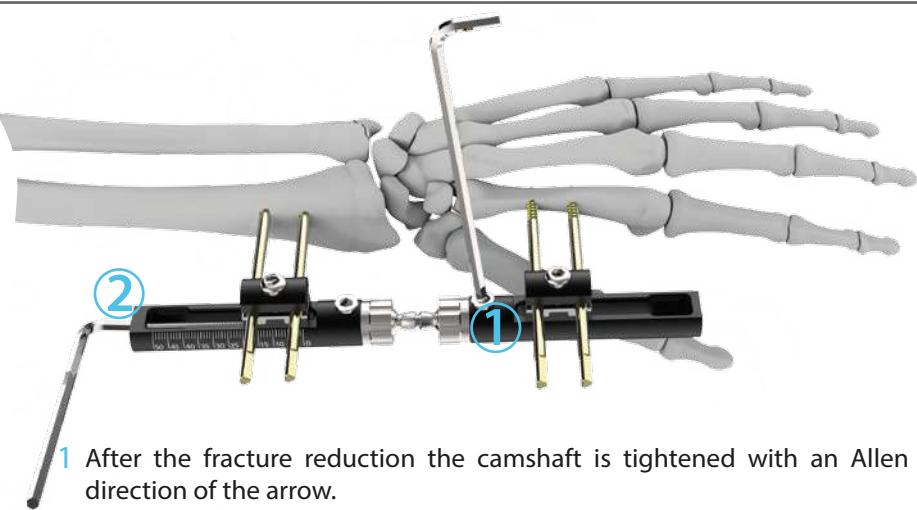

The fixator is temporarily mounted to the distal screws and the skin is marked for the proximal screw placement.

At that time the fixator body should be checked if it is partially open. Preserving the superficial branch of the radial nerve, a 3 cm skin incision is made. Then two Schanz screws are placed to the radius in the same way.

Following placing the Schanz screws the screw on the clamp is tightened with a 4 mm Allen key.

- 1 After the fracture reduction the camshaft is tightened with an Allen key in the direction of the arrow.
 - 2 For achieving controlled compression and distraction, the locking bolt under the clamp is loosened and the central part of the compression distraction unit is turned by an Allen key.
- After obtaining the desired compression distraction the locking bolt of the clam is tightened for finishing the fixation.

NONBALL-JOINT FIXATORS

LRS

SEGMANTEL FIXATOR

It is a single rail system fixator that can be placed from two up to four clamps.

LRS also includes if required, different designed clamps as Micrometric swiveling correction clamp and T-clamp for the correction of specific deformities

For the bone transport with segmental dynamic fixator an osteotomy is performed at the metaphyseal area.

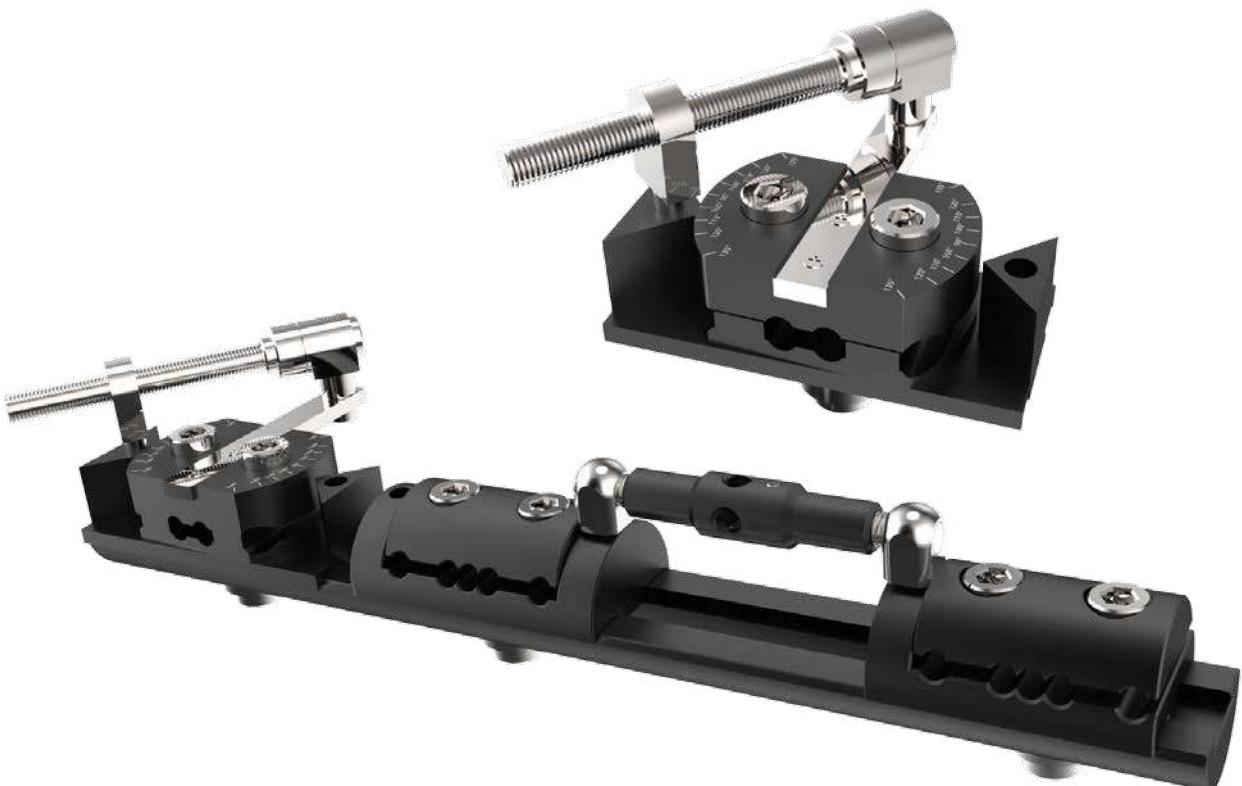

Then as the callus formation starts, the separated bone segment is slid with the callus formation. Day by day a certain amount of length in the right direction tries to fill the defect gap. Therefore with another osteotomy far from the first osteotomy line more lengthening can be performed by callostasis.

In shorter extremities some gaps which are not that big, can be closed immediately with the surgery.

Therefore with another osteotomy far from the first osteotomy line more lengthening can be performed by callostasis.

LRS DEFORMITY FIXATOR

LRS system is used firstly at the orthopedics of the lower extremity long bones, nonunion treatment, bone transport, deformity correction and lengthening.

It is also used in the special cases given below;

Due to the high stability of the system at the complex trauma treatments,

LRS fixating femoral varus angle and the tibia, valgus deformities such as a variety of correction and the callus distraction in cases of bone lengthening,

In single centered extention and correction of deformity,

In multi-centered operations; bone transport, compression and simultaneously distraction in different areas,

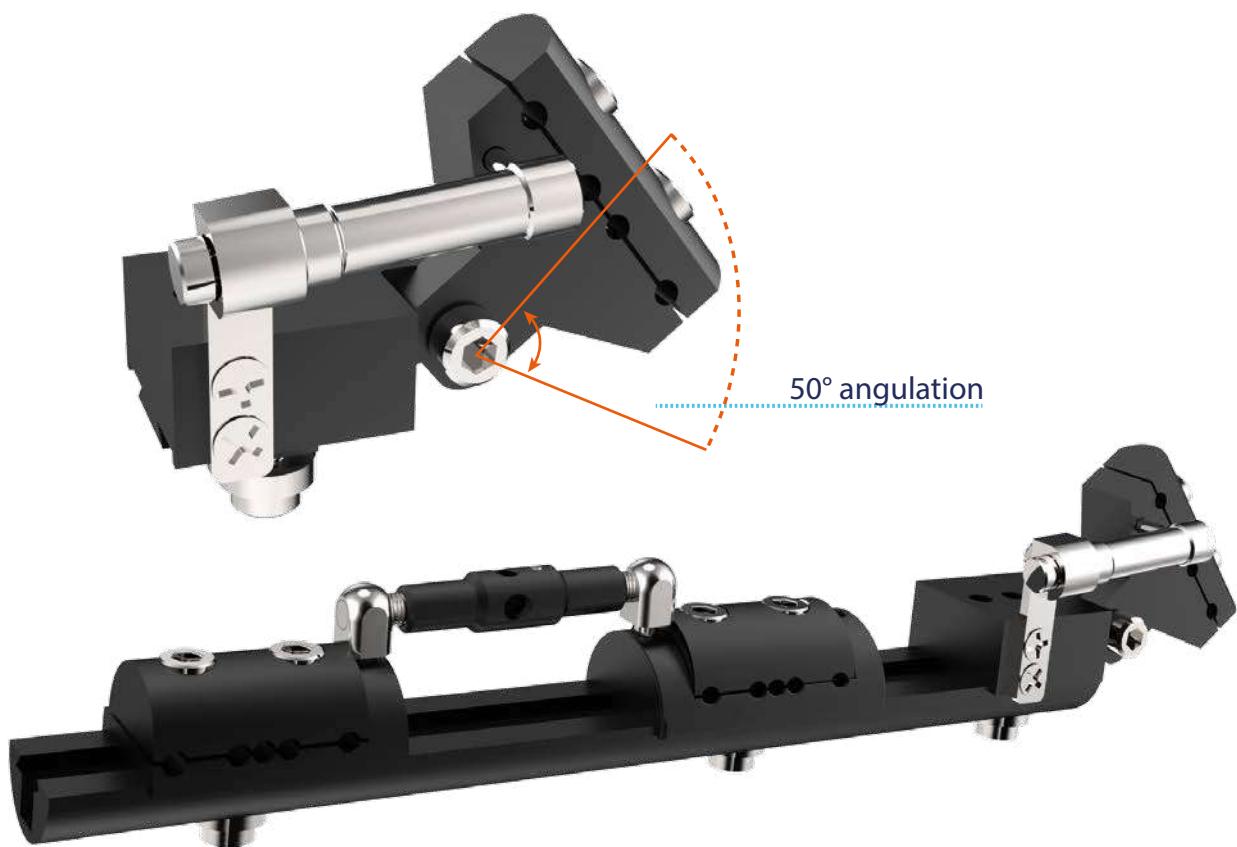

In correction of deformity by double centered extention & distraction,

In repairment and extension of the new fractures of extremity, non-union bone problems and cases of soft tissue damages and bone loss in distraction surgery.

SEGMANTEL T CLAMP LIMB FIXATOR

Distal femur procurvatum/ recurvatum deformity is corrected gradually by hemicallotasis with specially angled T clamp structure of the fixator.

It is also used in the special cases given below;

In distal femur segmental fractures.

In segmental tibial large unstable shaft fractures with the usage of T clamp for proximal segment.

In the detection of distal tibial fractures; in the metaphysis with T clamp.

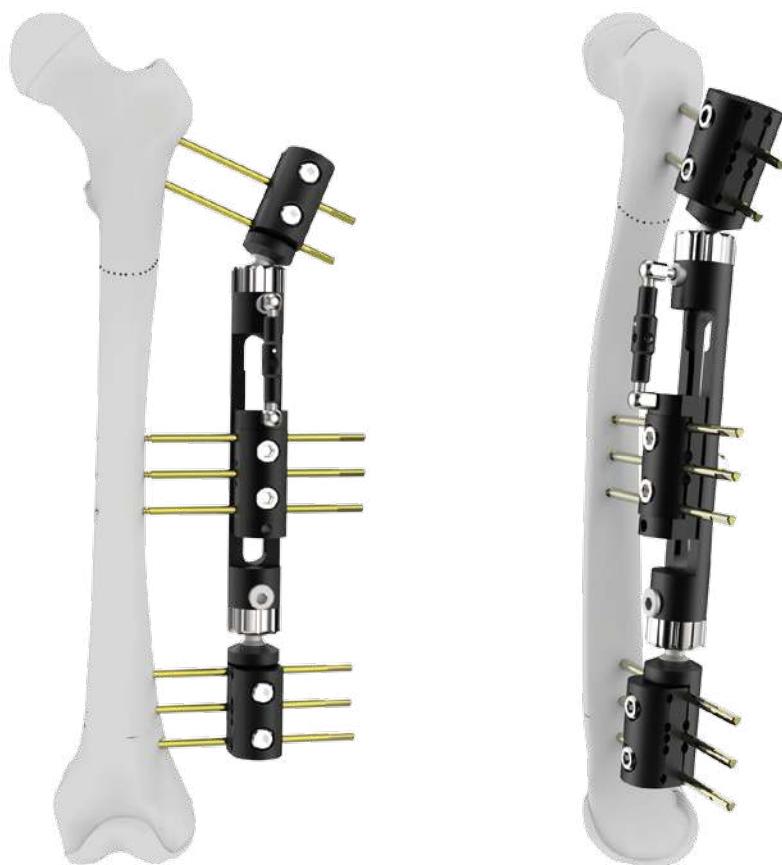

In the detection of proximal tibial fractures: gradual angular correction of proximal tibia varus or valgus deformities (Osteotomy is done by inserting T clamp on the proximal anteriorly).

In gradual angular correction of proximal varus or valgus deformities of short tibia and in cases of bone lengthening in deformity line.

SEGMENTAL MULTIAXIAL BONE TRANSVERSE FIXATOR

It is used for indication of femur segmental bone transport.

Fixator is compatible with femur lateral grade by means of ball joint and double row sandwich structured external clamps at the last part and also by means of a clamp able to transport segmental at the middle.

Fixator can be moved to distal and proximal by fixing of DC unit with middle clamp 6mm L-key.

OWO-FIX
HIGH TIBIAL OPEN WEDGE OSTEOTOMY FIXATOR

(R)

OWO-FIX®

HIGH TIBIAL OPEN WEDGE OSTEOTOMY FIXATOR

Indications

Indications of High tibial osteotomy (HTO) external fixator are as follows;

Genu varum deformities that the mechanical axis is impaired in varus position and unicompartmental osteoarthritis cases,

When the medial compartment is overloaded after meniscectomy,

In Osteochondral defects with resurfacing arthroplasty applications,

The description in the scientific literature for the requirements of HTO applications which are stated below are also valid for the OWO-FIX surgery,

The presence of knee osteoarthritis with involvement of medial compartment,

Lack of inflammatory arthritis in the knee joint.

When the knee range of motion is over 100 ° ,

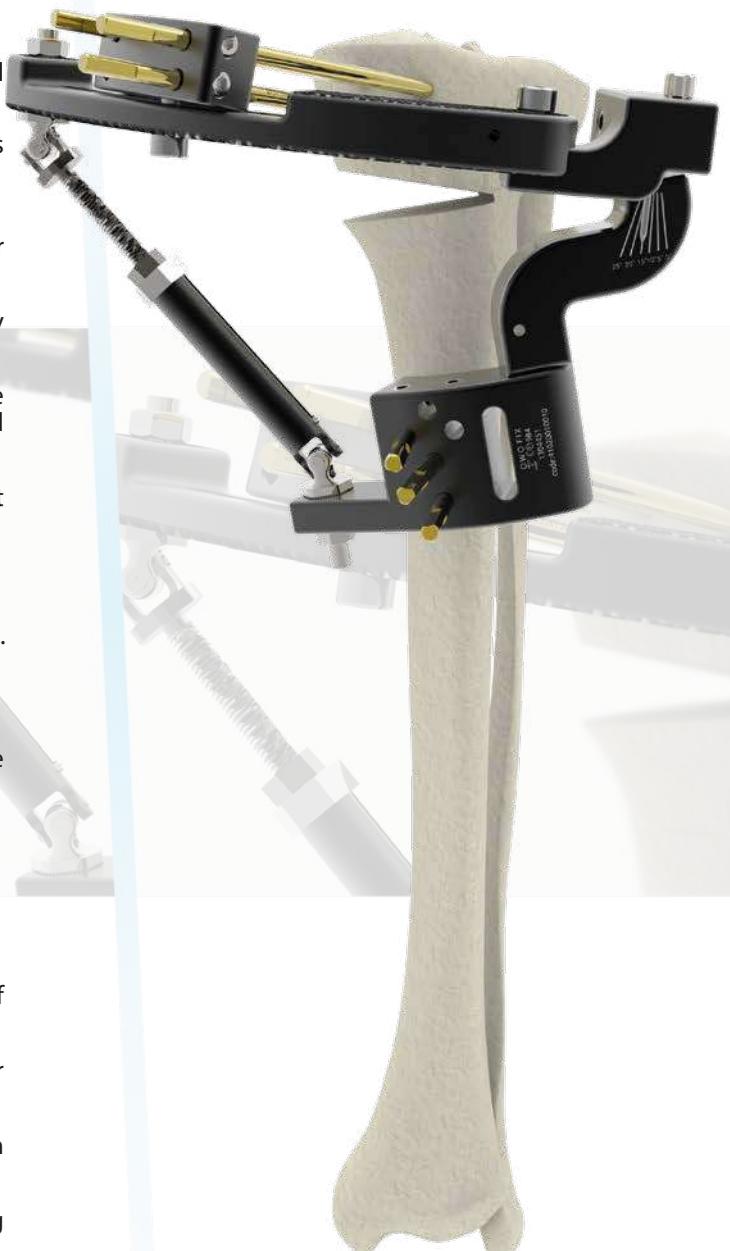

The lack of joint laxity in the medial and lateral planes.

Flexion contracture less than 15 ° ,

The absence of the patellofemoral joint osteoarthritis,

Genu varum deformity cases that does not require more than 20 ° correction,

Body mass index of less than 25.

Aims

To reduce the operation time with the easy fixation of the system to the tibia.

To apply the osteotomy after the fixation of the fixator (it is different from the plate and nail applications).

To apply the osteotomy through a 3-4 cm skin incision without performing wide soft tissue dissection.

To apply gradual and controlled distraction during and after osteotomy.

To prevent the uncontrolled breakage of the osteotomy line (extension of the osteotomy line to the lateral cortex or lateral tibial plateau); even if breakage occurs, to allow the patients early full weight-bearing due to the stability of the system.

To remove the system after obtaining the union without the need for a second surgical procedure.

To avoid the problems associated with large skin incision which may occur in open surgeries.

Distinctive Advantages

It does not require application of a plaster-splint after the operation.

The patient can mobilize with full weight-bearing immediately on the postoperative period. OWO-FIX system has stable structure that allows early active motion and full weight-bearing even if the presence of lateral cortical damage or tibial plateau fracture occurred during the surgery.

There is no need to make a large skin incision.

In the early postoperative period, there is a possibility to adjust the amount of correction according to the radiographic control.

There is no need for a second surgery (and anesthesia) for removal of the system. OWO-FIX can be removed in outpatient clinics.

Features

OWO-FIX system is comprised of carbon fiber proximal arch, aluminum and titanium based additional components.

Therefore it is quite light. The weight of fixator varies between 400 - 480 g according to the used schanz screws.

The distraction can be applied without damaging the lateral cortex because of the projection of the hinge point which has the same projection with the osteotomy line which extends to the lateral cortex on the frontal plan.

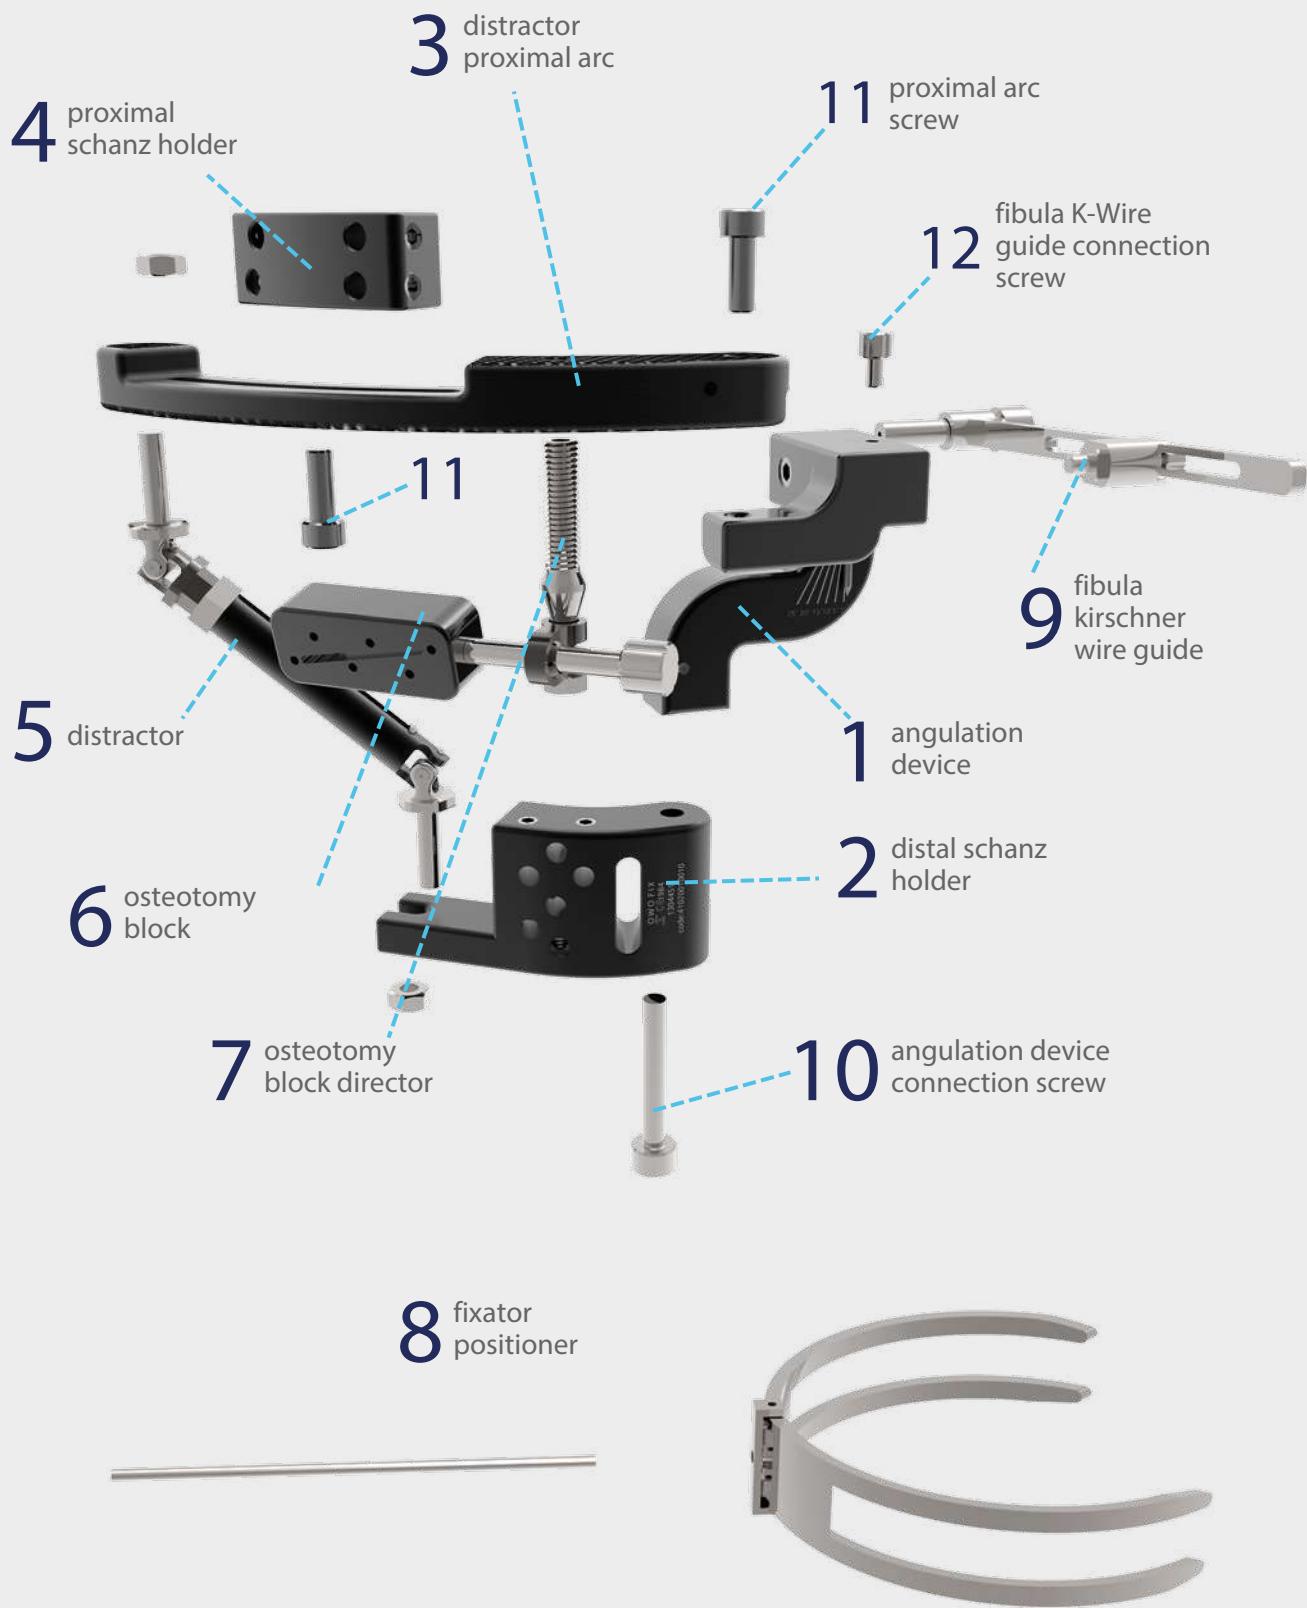

Owing to the 10° posterior slope on the osteotomy block the tibial slope is regulated automatically (If desired, posterior slope angle could be changed with the motion of the osteotomy block).

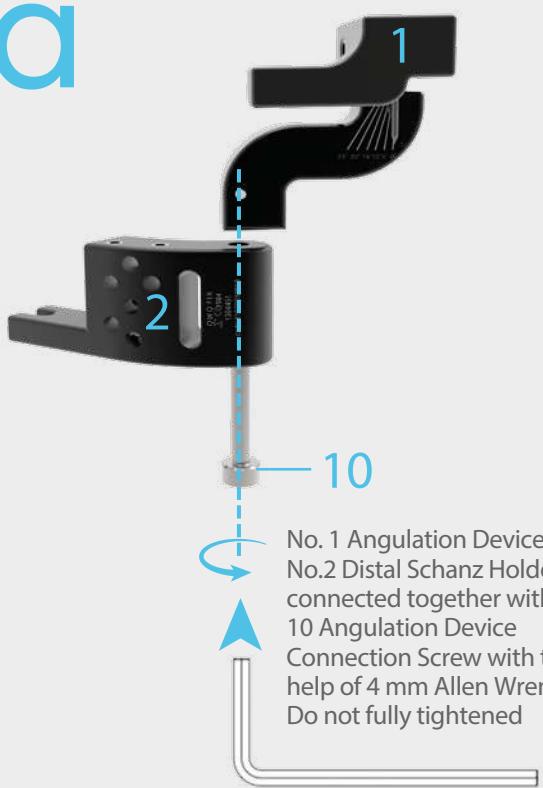

Different systems are available for the left and right tibia.

It is possible to insert schanz screws in different angles and configurations over the proximal and distal schanz holders.

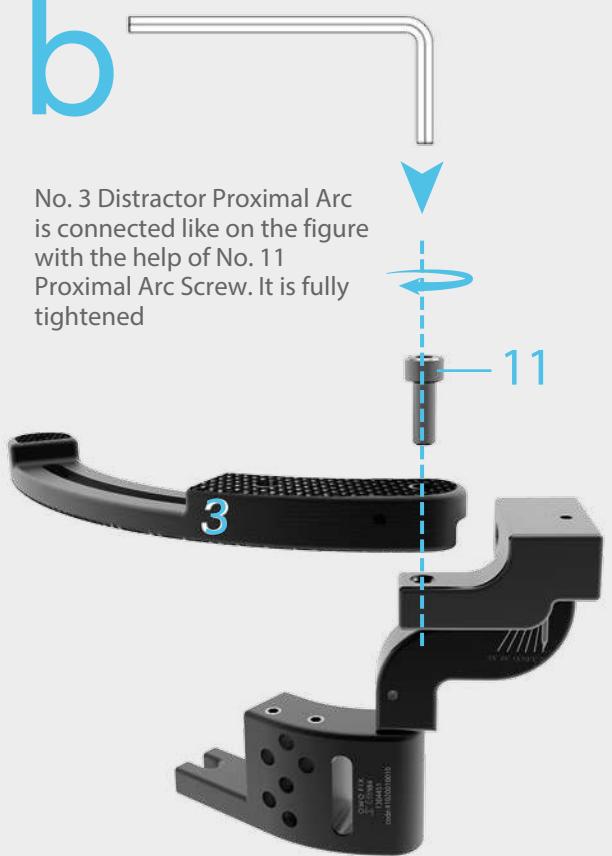

On the early postoperative period, adjustment of the angular correction can be made on the system with the help of the distractor.

INSTALLATION

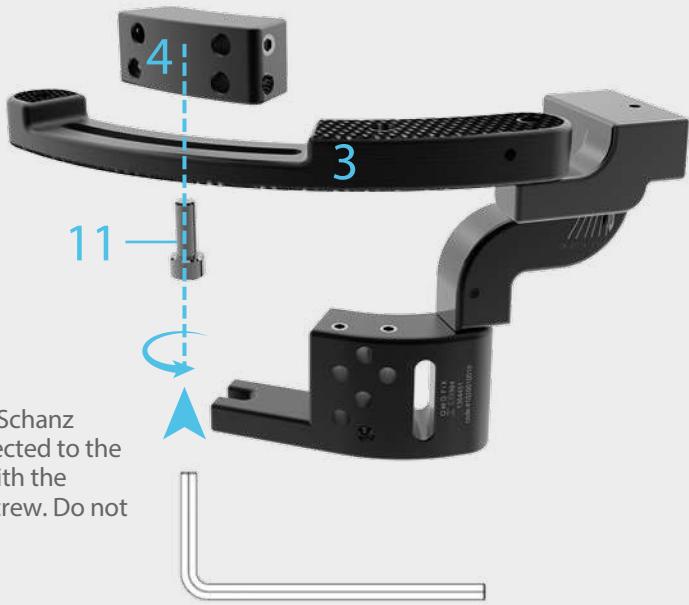

a

No. 1 Angulation Device and No. 2 Distal Schanz Holder are connected together with No. 10 Angulation Device Connection Screw with the help of 4 mm Allen Wrench. Do not fully tightened

b

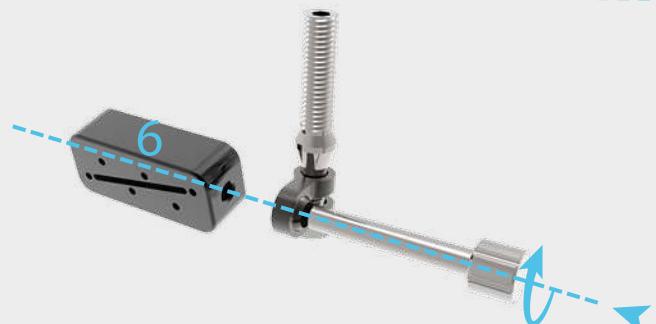

No. 3 Distractor Proximal Arc is connected like on the figure with the help of No. 11 Proximal Arc Screw. It is fully tightened

c

No. 4 Proximal Schanz Holder is connected to the Proximal Arc with the Proximal Arc Screw. Do not squeeze it

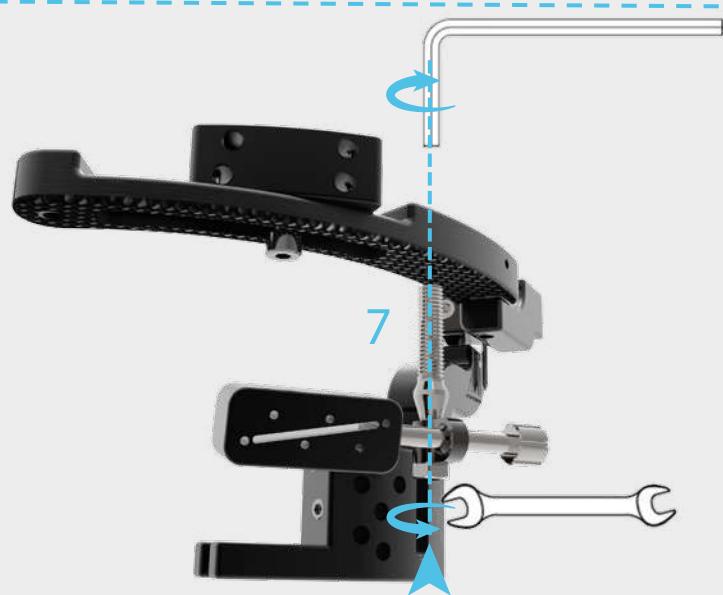

After the instalation of OWO-FIX during the application for easy and accurate sending of the schanz screws the screws of the connections at the figure a and c are not fully squeezed

d

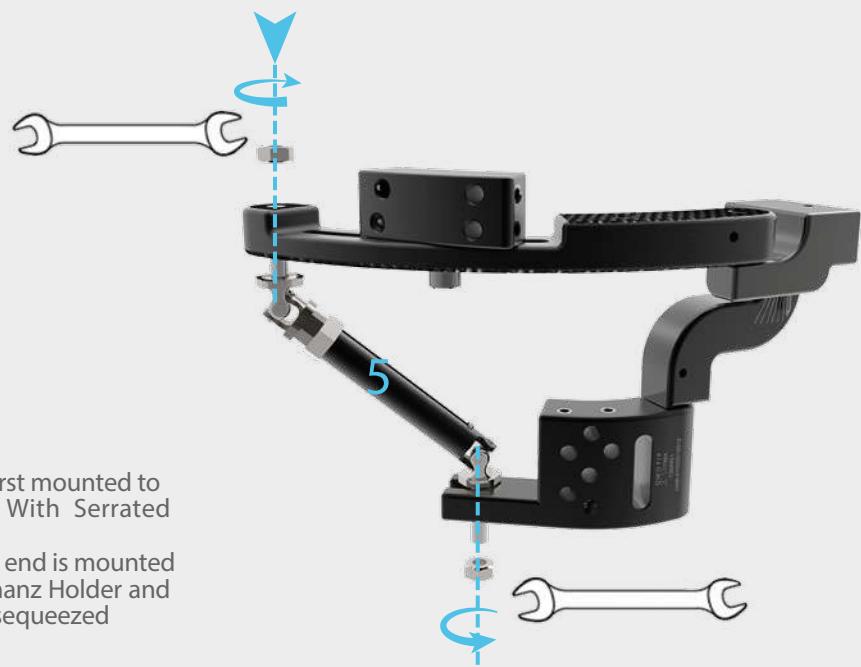

No. 6 Osteotomy Block is
mounted to the Osteotomy
Block Director

e

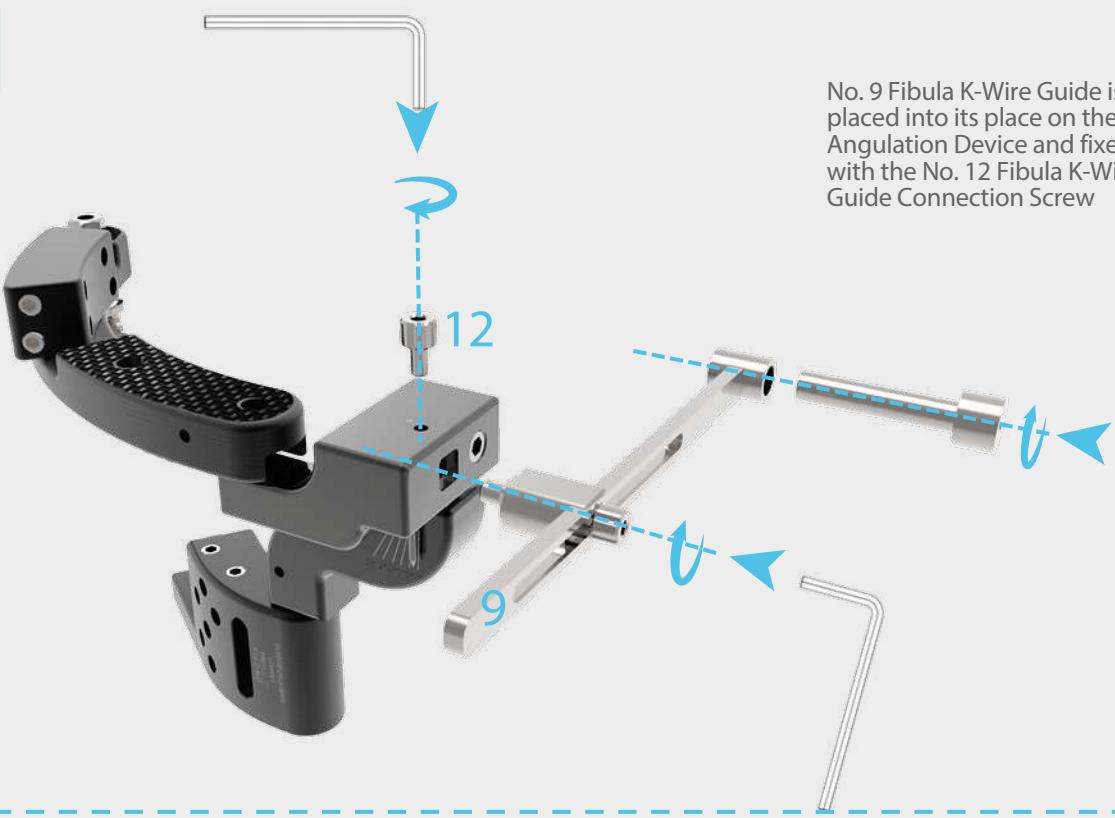

No. 7 Osteotomy Block
Director is screwed into its
place on the Proximal Arc

f

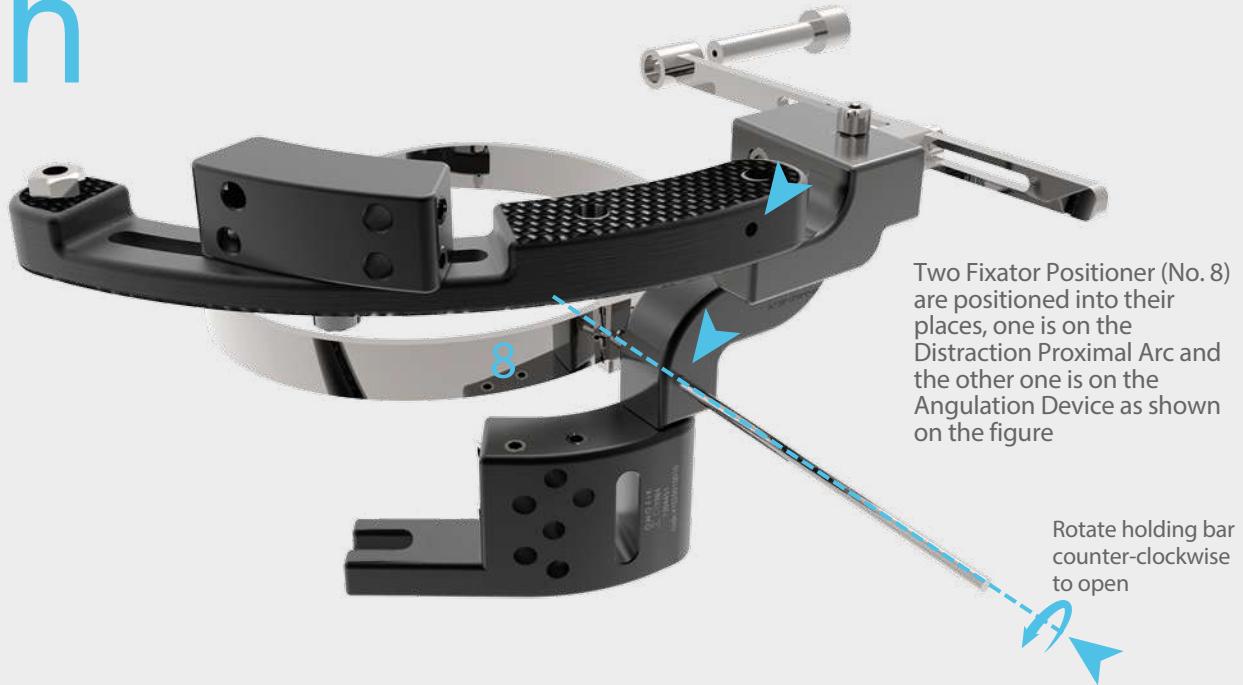

No. 5 Distractor is first mounted to
the Proximal Arc With Serrated
Washer and a Nut
After that the other end is mounted
to the Proximal Schanz Holder and
both nuts are fully squeezed

MAMEF

The logo features the word "MAMEF" in a bold, dark blue sans-serif font. The letter "A" is unique, as it is filled with a light blue circle, while the other letters are solid dark blue. The entire logo is set against a background of a complex, light gray network graph with numerous nodes and connecting lines, symbolizing connectivity or a system.

In light of today's technology and biomechanical studies, a new generation of external fixator which has superior technical features has been made of lightweight titanium material that has the ability to offer high resistance and stabilization allowing to obtain the desired reposition on different planes simultaneously has been developed.

So called the "Modular Adjustable Multifunctional External Fixator MAMEF" allows for rotational correction, segmental transportation and angular correction of the deformity in addition to the axial plane corrections of the pathological lower extremity.

This unique new generation external fixator system can be used for the fixation of the lower extremity fracture, limb deformity correction in frontal, sagittal and oblique planes, shortening and lengthening osteotomies, malunion or nonunion (pseudoarthrosis) conditions, elimination of joint contractures and correction of congenital limb deformities.

Features

MAMEF is made of titanium alloy.

The fixator has a special and effective connection system in order to maintain the reduction of fracture obtained with MAMEF.

The fixator allows 360 degree rotational motion, flexion-extension and varus-valgus mobility are obtained safely.

$30+30=60^\circ$ of clamp angulation can be carried out (in all directions depending on the long axis of the fixator).

Transactions can be done individually or in combination with this external fixator system and the other parts of the fixator which are pre-fixed sections will not be affected by courtesy of this feature of the fixator during the secondary applications.

MAMEF allows Schanz pin placement for all planes and any desired configurations.

Trans Angled Pin Fixation Bolts provide to place Schanz pin transversely and 135 degrees in an angle. Poliaxial Pin Fixation Bolts allow to position Schanz pin in different planes and they can be combined with each other (Lego Feature).

This external fixator is suitable for use hybrid with the type of ring and bar fixator systems which provide to use as circular and small fixation wires in case of the purpose of fixation of the intra-articular and extra-articular fractures in metaphyseal application of femur and tibia and in case of poor bone stock conditions that is not suitable for large-diameter Schanz pin placement.

Eight different types of models and sizes including MAMEF (Short-Standard-Long), Translation-Rotation, Deformity, Segment Transportation, Single Jointed and Monoblock Trochanteric are all available.

MAMEF Arch and C Ring Module: This connection modules provide to use as circular of K-Wires and Schanz screws in different planes for fixation of the intra-articular and extra-articular fractures in femoral and tibial metaphyseal applications and in case of deformity correction applications.

Different lengths of cancellous and cortical Schanz screws are available up to 150 mm to 220 mm. The diameter of 5 mm and 6 mm Schanz screws can be used with this external fixator system.

UXXEF
Ultra Modular External Fixator

UXEF

Ultra Modular External Fixator

Ultra Modular External Fixator is a unique system that allows for a rigid osteosynthesis application, developed aiming at providing an effective continuation of the stabilization in the period of time to fracture healing after performing the desired anatomical fracture repositioning in the indications of operative external fixation technique of humerus, ulna-radius, metacarpus, hand, pelvis, femur, tibia and in metatarsus traumas.

Aims

To obtain the strongest stabilization and rigid osteosynthesis application.

To shorten the duration of operation owing to its easy implementation feature.

To give options to the surgeon for screw localizations depending on the fractured bone, its localization and the shape of the fracture line.

To supply usage of the new design external fixator for single or multi-planes application depending on the fractured bone, its location, the shape of the fracture line and the indication.

To provide good radiological evaluation thanks to its carbon fiber structure that shows radiolucent opacity in the radiographs and provides observation without making it difficult in addition to being in a lightweight.

After the frame is constructed, manipulations are performed for the fracture reduction by allowing movement in between the modules independently from each other.

Features

The system consists of rods, clamps and pins.

The structure of the rods are carbon fibre material (Titanium rod choices are optional).

There are rod–rod clamps that serve to connect two rods to each other and rod – pin clamps that provide to connect between rod and pin into the set.

Rod-pin clamps are available as a single and dual forms (to place two Schanz screws in parallel).

There are choices in types of rod-pin clamps into the set. They are open and closed rod-pin clamps.

“Dynamic Joint Distractor Unit” is available into the set.

UMEF is lightweight owing to its carbon fibre structure of rods and titanium made clamps.

UMEF provides ease of use.

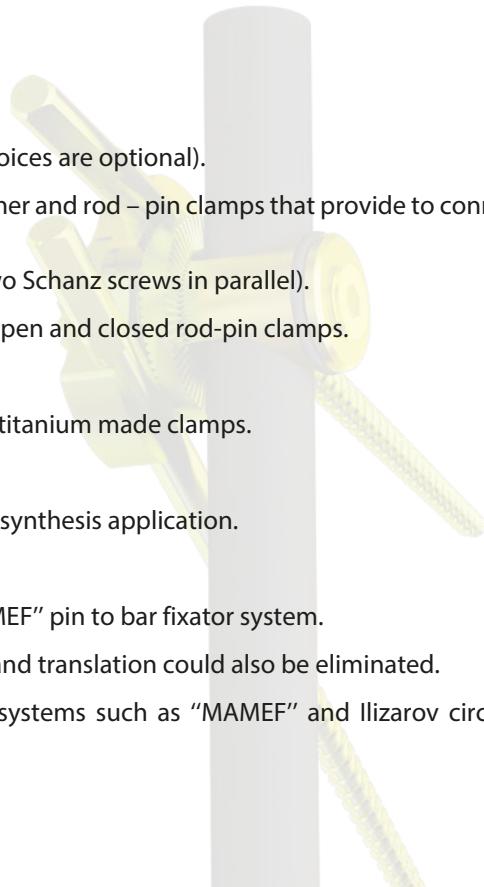

It allows to obtain the best stabilization by performing a rigid osteosynthesis application.

UMEF allows 360° movement in all three planes.

Compression, distraction and derotation are achieved by using “UMEF” pin to bar fixator system.

Varus, valgus, flexion and extension can be achieved with “UMEF” and translation could also be eliminated.

“UMEF” can be used as a hybrid with the other external fixator systems such as “MAMEF” and Ilizarov circular systems.

Distinctive Advantages

Allows three dimensional mobility.

To provide the ease of assembly, thanks to its advanced clamp designs, during the process of bringing the components together with no need for additional time and effort.

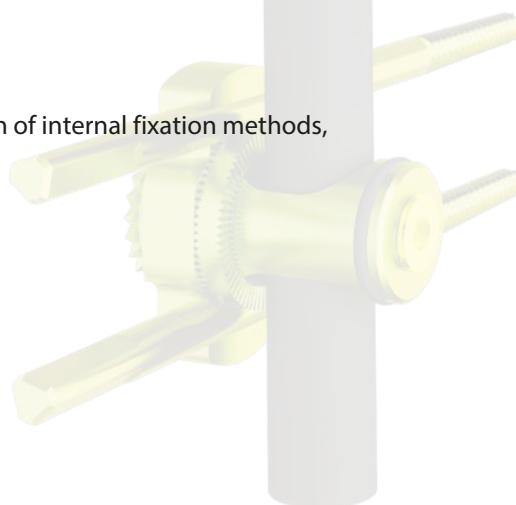

In positioning stage of Schanz pins, choosing the localizations of them as wished depending on the indications.

Thanks to its effective locking system, the positioned module is locked and afterwards, the other modules may be rotate, angulate and their lengths can be adjusted independently.

Provide a good radiological evaluation that is necessary postoperatively and for radiologic follow up of the fracture healing process owing to its carbon fibre structure.

Compatible with MRI.

It is a unique lightweight system due to its carbon fibre rod structure and its special feature clamp designs.

Indications

Complex fractures,

Polytraumatized patients who have fractures with no indication of internal fixation methods,

Patients with fractures and head & chest traumas,

Pelvic fractures,

Humeral and forearm fractures,

Femoral and tibial fractures,

Pediatric fractures,

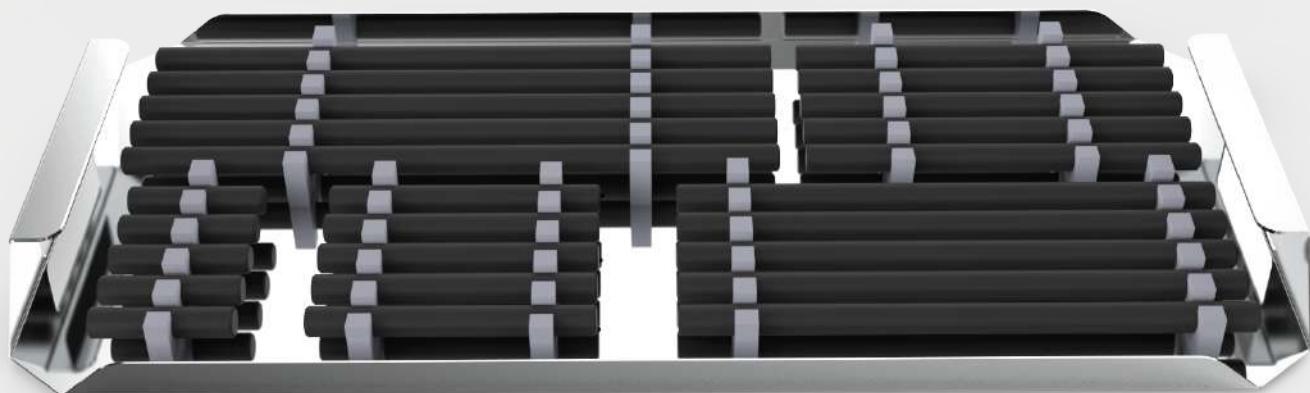

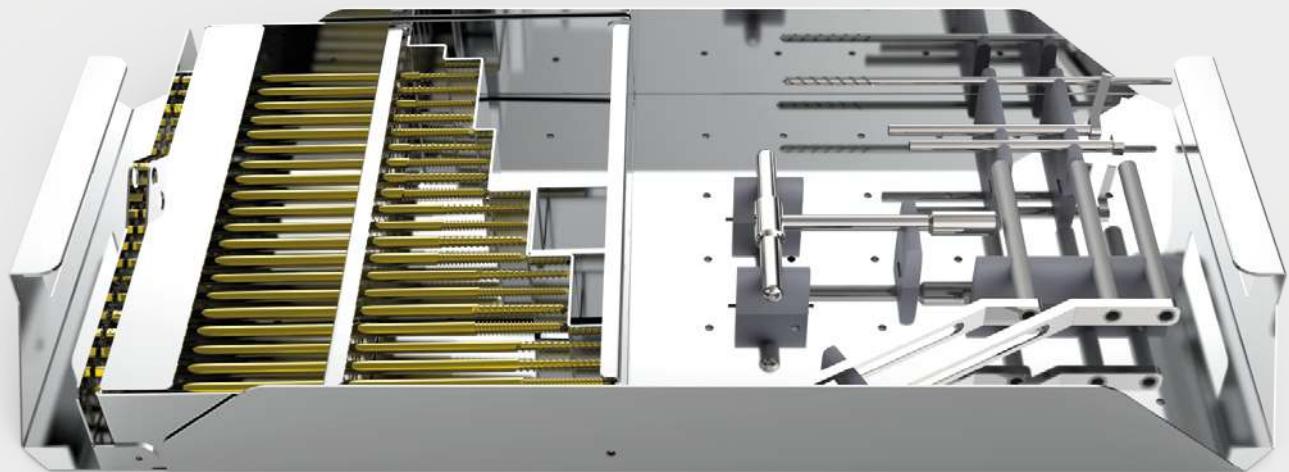

Metacarpal and metatarsal fractures,

Arthrodesis,

Osteotomies,

Infected pseudoarthrosis.

**ELBOW
FIXATOR**

ELBOW FIXATOR

Elbow fixator is developed innovatively as unilateral low profile adjusting flexion/extension, making passive distraction and it is designed suitable especially for osteotomy, elbow injuries and stiff elbow.

Concentric hinge allows to continue the flexion and extension between 0 and 120° and provides surgical advantage and radiographic usages. The mobility (flexion/extension) of the fixation can be limited to the desired extent through special provided rooved rod.

Ulnar and humeral components with the feature of pin-to-bar, providing ability to fine tune for axial rotation and direction of hinge are placed in the system.

Through these features, it enables a desire level usage of bone schanz screw for ulna and humerus applications.

INSTALLATION

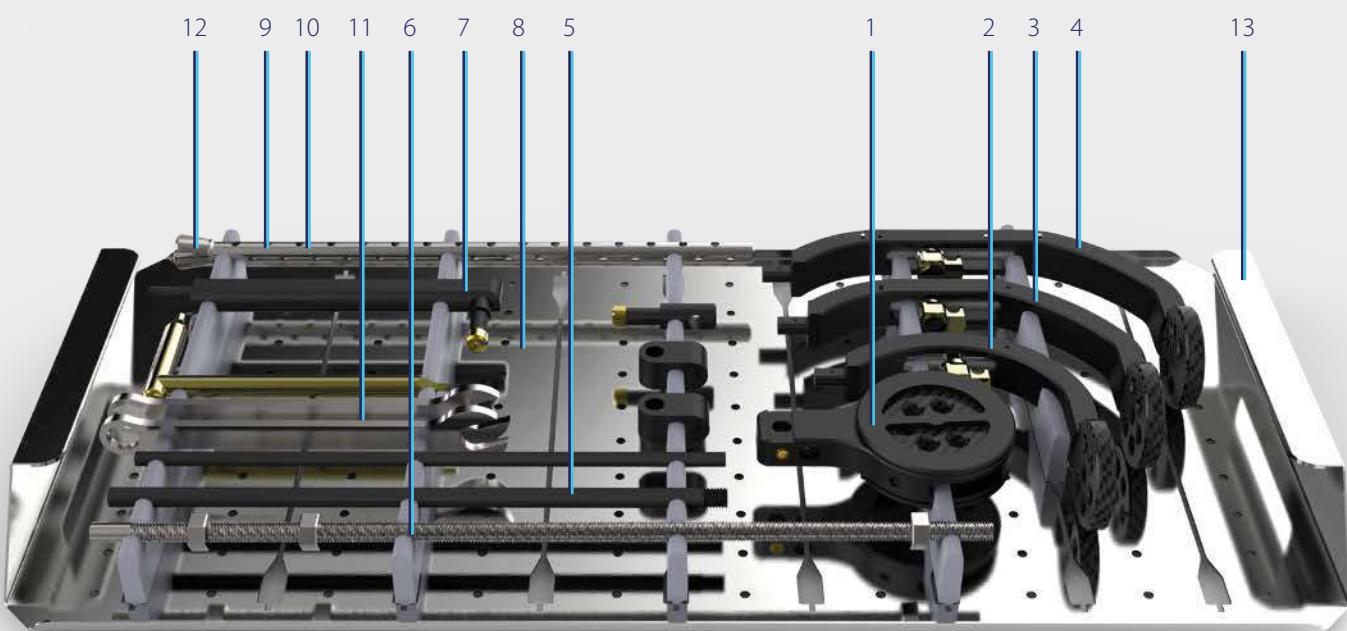

FIXED OF THE FLEXION / EXTENSION IMPLANT

ELBOW FIXATOR SET

Indications

Lengthening, extremity lengthening,
Closed and open fractures,
Bone loss (trauma tumor, infection),
HIP dysplasia and deformity corrections are some of the indications.

Advantages

Anatomical fracture reductions are provided not only on the fresh fractures even on few weeks or months old fractures,

Endless possibilities of fracture fixation,

Minimal trauma of the soft tissue,

Closed fracture area,

Optimal bio mechanic stability,

Reconstruction of wide bone defects and acute or gradual correction of deformities,

Early joint movement,

Protecting the blood circulation of the bone,

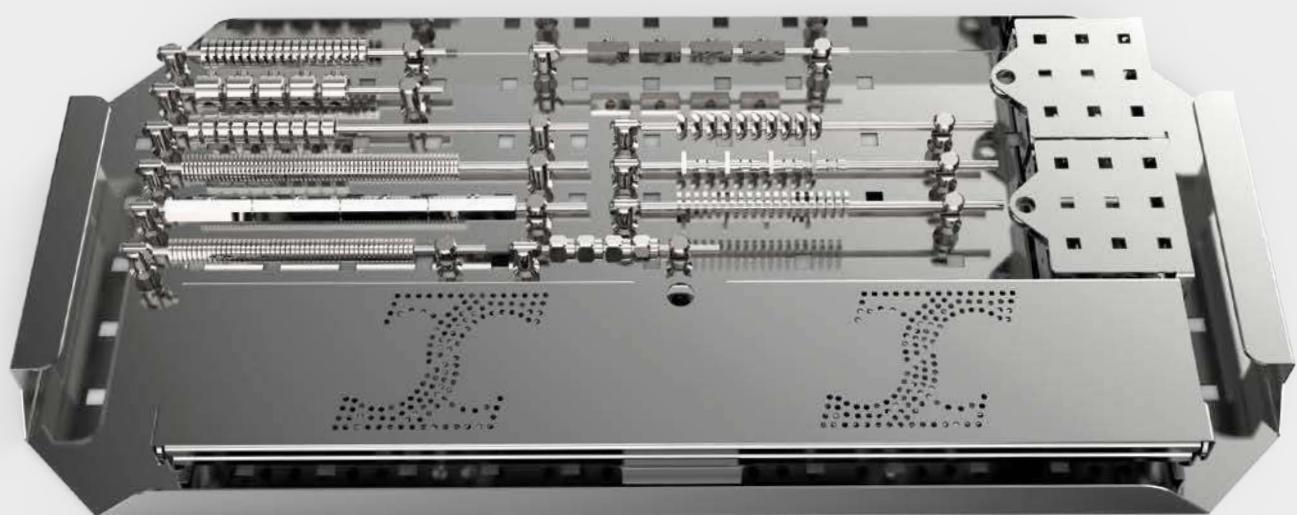

Minimal bleeding during the surgery.

ar TOR

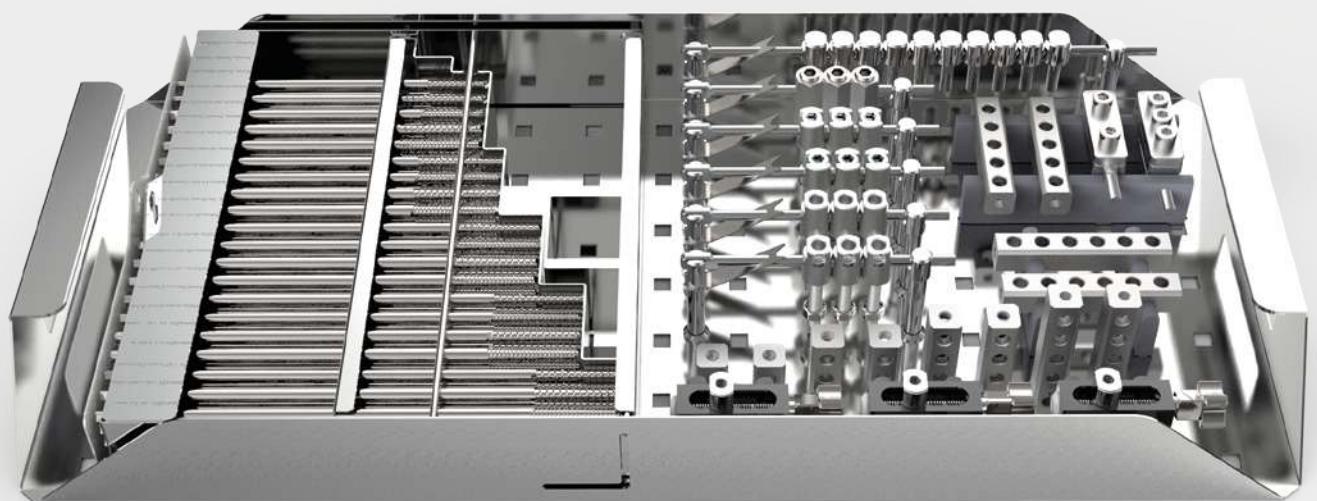

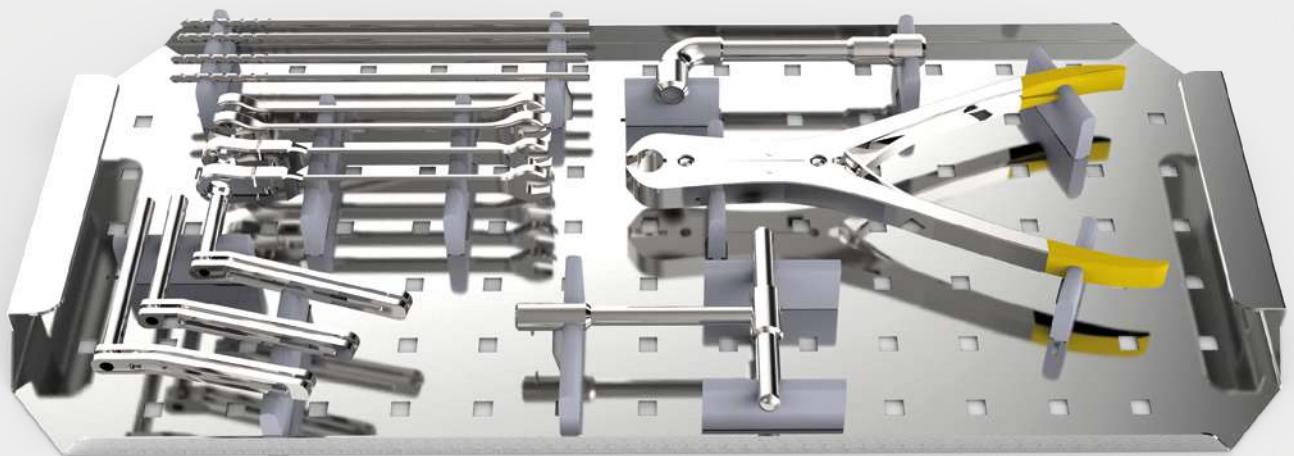

Please check the own catalog for detailed informations.

mini
FIXATOR

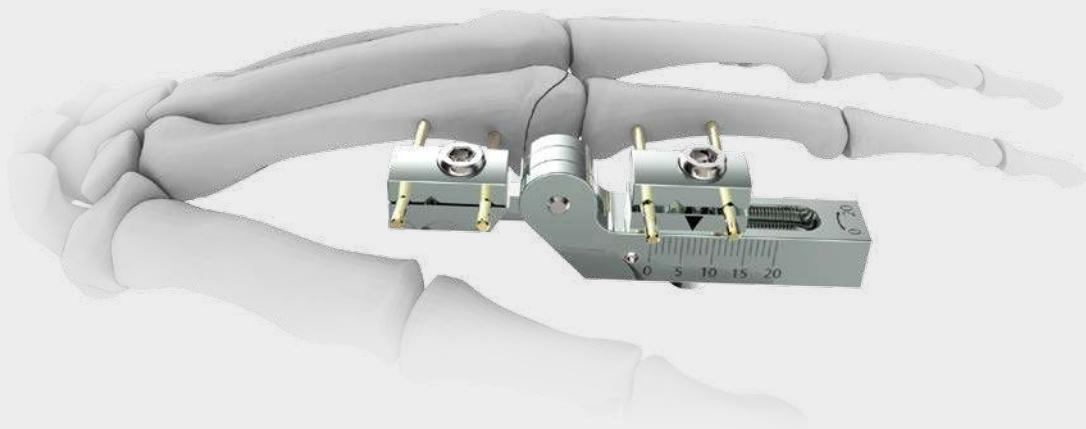

FINGER MANDIBULAR FIXATOR JOINT

It is a jointed clamp forming horizontal hinge structure, and it is capable of the compression and distraction.

200° angulations.

Distraction-compression screw provides 0.5mm movement when it is completed a full tour.

There is a scale on the fixator providing control of distraction and compression.

CAT. CODE

41141020100

BARCODE

8698673456655

DESCRIPTION

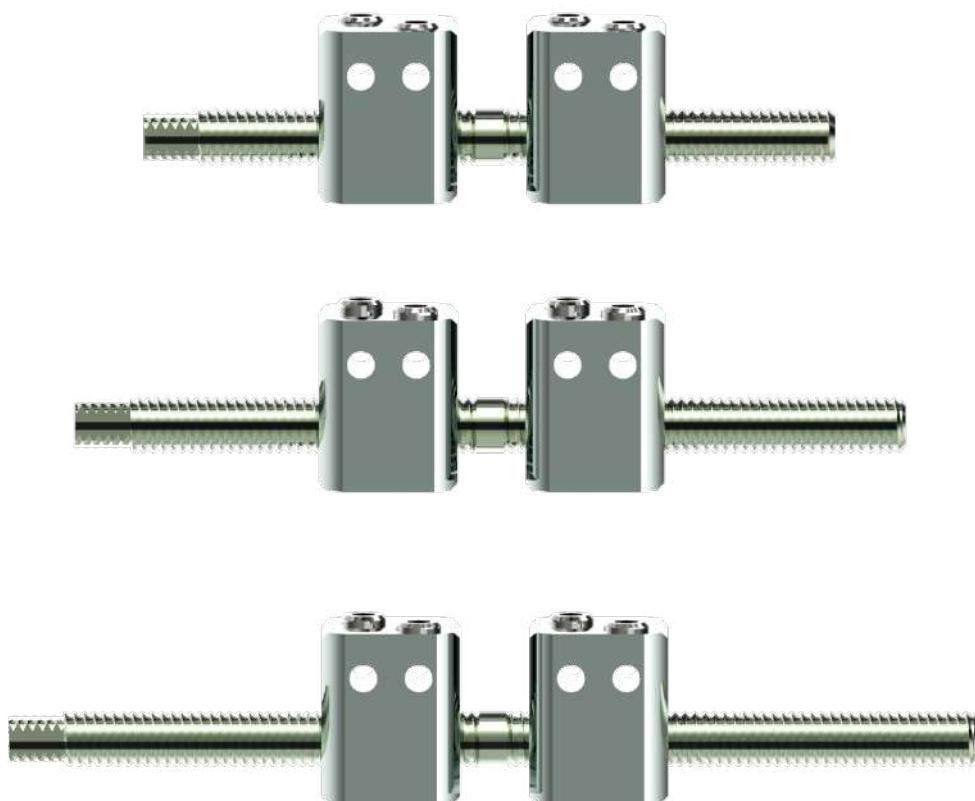

FINGER AND MANDIBULA FIXATOR JOINT

TYPE

JOINT

LENGTH (mm)

60

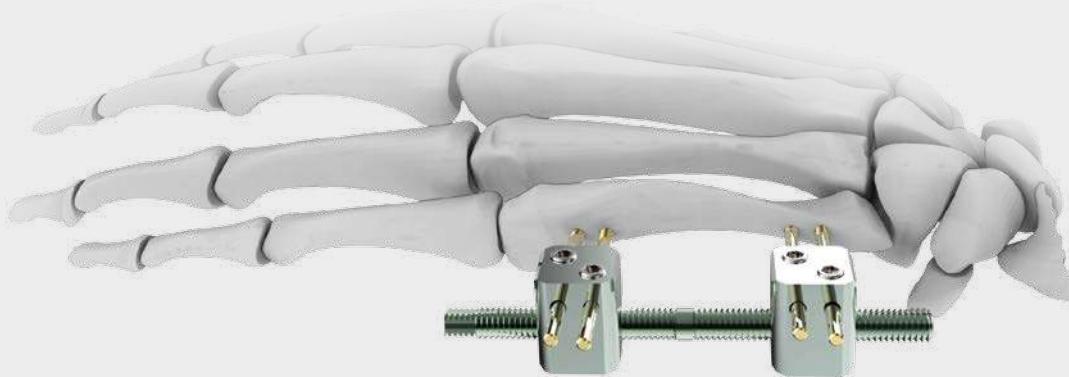

FINGER MANDIBULAR FIXATOR

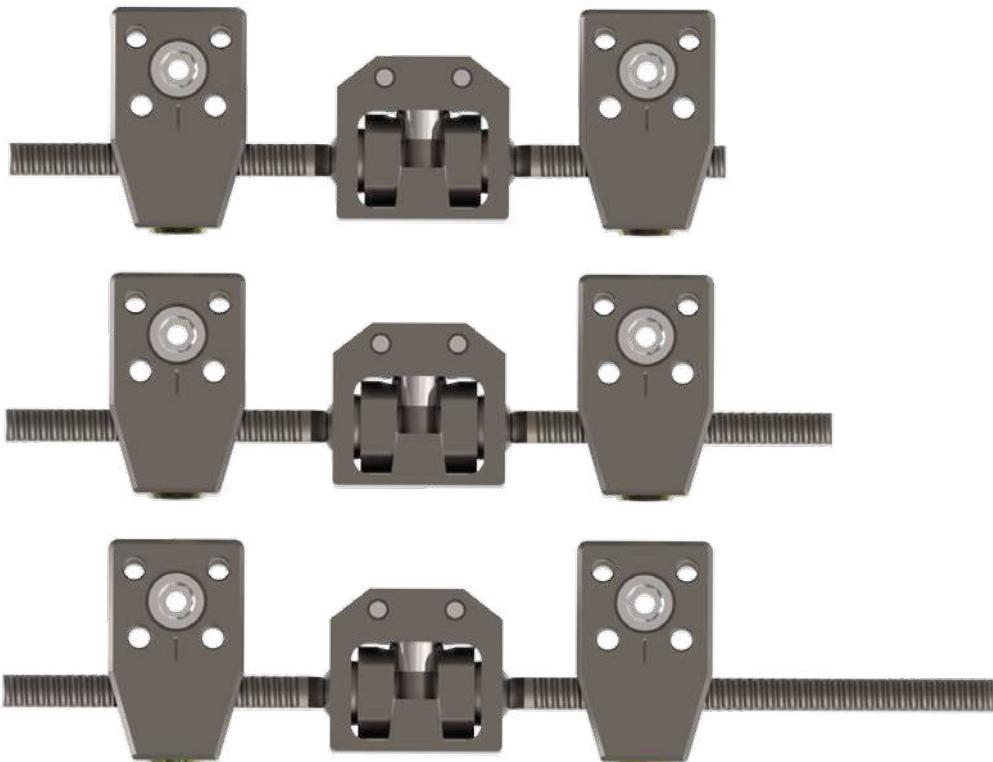

Consisting of two or three clamps which mobilizes integrated with threaded bar.

Compression and distraction movement is obtained after the fixing the clamps by turning the fixator bar with key holders.

Fixator bar provides 1.5 mm movement between clamps when it is swivelled a full tour.

CAT. CODE	BARCODE	DESCRIPTION	TYPE	LENGTH (mm)

41140010100	8698673456662	FINGER AND MANDIBULA FIXATOR LONG	LONG	70

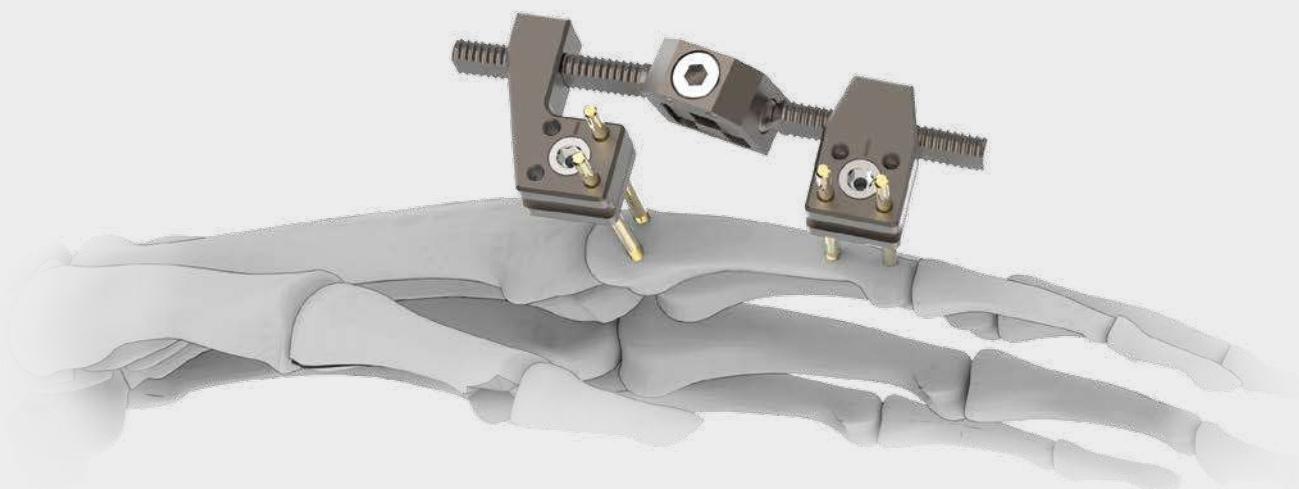

MINI FIXATOR

Mini fixator consists of two bars fixed with the moving body and clamps forwarding on the threads of these bars with the DC discs.

It is applicable even in confined spaces and enables to send schanz screws parallel to the articular surface under favour of its innovative design.

CAT. CODE	BARCODE	DESCRIPTION	TYPE	LENGTH (mm)
42020030001	8680858406685	MINI FIXATOR SHORT	SHORT	65
42020020001	8680858406678	MINI FIXATOR STANDARD	STANDARD	75
42020010001	8680858406661	MINI FIXATOR LONG	LONG	90

MINI FIXATOR LENGTHENING BAR

Mini fixator extension bar is used for bone extension and transport.

It has three different lengths (80-100-120mm).

It is typically used with two schanz screws but third schanz screw can be used to increase stability especially in osteoporotic and metatarsal bones.

Extension bars are used with standard and/or L-clamp and spacer.

One side of the spacer which is designed compatible with the clamp edge sections is angular and the other side of it is flat.

DC nut is applied in a way that it touches the flat side of spacer by positioning standard clamp in contact with side.

Thus, full surface contact is provided between the DC nut and the standard clamp during distraction.

There is no need for a connector / spacer if the distraction will be done using the T-clamp.

These processes must be done before fitting the second clamp in either situations.

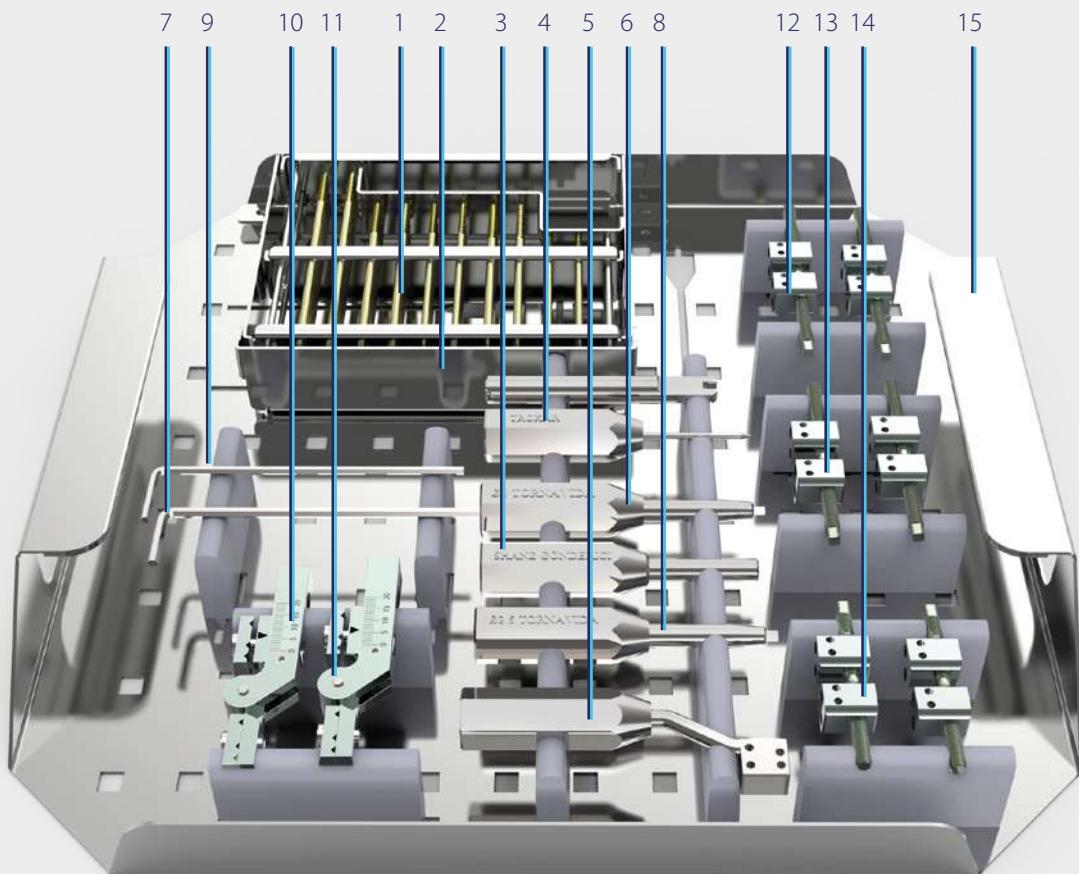

DC nut moves 1 mm when it is turned a full tour.

HYBRID CLAMPS

Hybrid fixator is not a special fixator system. It is formed by the combination of two separate fixators. Ilizarov ring is assembled to DAF, UMEF and MAMEF fixator systems by special designed clamps. Hibrid fiksatörler tek bir sistemden oluşmamaktadır. DAF, UMEF ve MAMEF sistemlerinin özel tasarlanmış bağlantı clampleri ile ilizarov çemberlerinin birleştirilmesinden oluşur.

MAMEF HYBRID CLAMP MAMEF Ring Connection Unit

It allows to connect MAMEF system to Ilizarov rings.
