the needle curvature varieties are 3/8 , 1/2 , ¼ circle, J shaped , and Sraight .

Damacryl and PGA suture elicits a minimal acute inflammatory reaction in tissues, which is followed by gradual encapsulation of the suture by fibrous connective tissue. Progressive loss of tensile strength and eventual absorption of Damacryl and PGA sterile, synthetic, absorbable sutures occurs by means of hydrolysis, where the copolymer degrades to its monomers (glycolic and lactic acids), which are subsequently absorbed and metabolized in the body Absorption begins as a loss of tensile strength without appreciable loss of mass.

The material holds approximately 65% of its tensile strength by two week

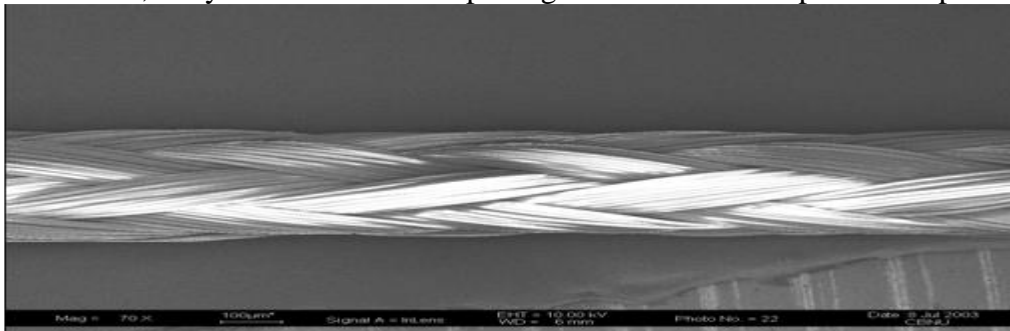

Surgical suture is a medical device used to hold body tissues together after an injury or surgery.

It is used for closing and covering suturable wounds under sterile conditions by initially suturing and stapling the wound.

Damacryl and PGA suture is coloured using Beige(undyed) or Violet colored multifilament braided, multifibers according to the size of the strands that meets all the requirements of the European Pharmacopoeia (EP) for Synthetic Absorbable Multifilament Sutures and the requirements of United States Pharmacopoeia (USP) Absorbable Sutures except for a slight oversize in diameter

External appearance description

Table 1 USP <861> Standard diameter and knot tensile strength

Table 1. Synthetic suture-The average diameter of the strands being measured is within the tolerances prescribed in Table 1 for the respective size. None of the observed measurement is less than the midpoint of the range for the next smaller size or greater than the midpoint of the range for the next larger size.

Adverse effects associated with the use of this device include wound dehiscence, failure to provide adequate wound support in closure of the sites where expansion, stretching, or distension occur, failure to provide adequate wound support in elderly, malnourished or debilitated patients or in patients suffering from conditions which may delay wound healing, infection, minimal acute inflammatory tissue reaction, localized irritation when skin sutures are left in place for greater than 7 days, suture extrusion and delayed absorption in tissue with poor blood supply, calculi formation in urinary and biliary tracts when prolonged contact with salt solutions such as urine and bile occurs, and transitory local irritation at the wound site.

Broken needles may result in extended or additional surgeries or residual foreign bodies. Inadvertent needle sticks with contaminated surgical needles may result in the transmission of blood borne pathogens.

1.9. Material Specifications:

The following components and compounds are used for the manufacturing of the surgical sutures:

1.9.2.NEEDLE:

Needle material is made from stainless steel and meets the internationally accepted specifications of surgically used metals

1.9.3. Tipping solution Araldite Standart

Araldite is a low visocisty cyanoacrylate adhesive for assembling medical device. It is used to harden the tip of the suture in order to enable a easier suture insertion into the needle. The section that contains the adhesive does not remain in the body.

Araldite offers the most comprehensive line of adhesives and sealants available to the medical device industry. These USP class VI and/or ISO-10993 compliant products are designed specifically for the assembly of medical devices where toxicity testing and sterilization resistance are required.

1.9.4. Specification of primary and secondary packaging material

Primary packaging material is made of Aluminium foil

Secondary packaging material is made from a pouch made of medical paper

The patients are used for all people who are need to ligate, close and cover suturable wounds under sterile conditions by initially suturing the wound due to gastrointestinal, obstetric and gynecologic and urologic surgery.

1.11. Intended User

The device should used by physician and/or surgeons.

1.12. Repeat Applications, Including Any Restrictions as to the Number or Duration of Reapplications

After surgery, the closing and covering can be repeated if an undesirable case would be occurred and/or the wound would open. There is not any restriction as to the number or duration of reapplications.

1.13. Single Use / Reusable

The device is only single-used.

Repeat Applications, Including Any Restrictions as to the Number or Duration of Reapplications

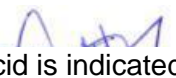

After surgery, the closing and covering can be repeated if an undesirable case would be occurred and/or the wound would open. There is not any restriction as to the number or duration of reapplications

1.14. Mechanism of Action / Principles of Operation

DAMACRYL AND PGA sutures elicit minimal acute inflammatory reaction in tissues, which is followed by gradual encapsulation of the suture by fibrous connective tissue. Progressive loss of tensile strength and eventual absorption of DAMACRYL AND PGA sterile, synthetic, absorbable suture occurs by means of hydrolysis, where the polymer degrades to glycolic acid which is subsequently absorbed and metabolized by the body. Absorption begins as a loss of tensile strength without appreciable loss of mass. The material holds approximately 75% of its tensile strength by the end of two weeks and approximately 45% by the third week. The absorption is completed in approximately from 60 to 90 days.

1.15. Biodegradation mechanism of the device

The literature describing the biodegradation mechanism for PGA polyglycolic acid is indicated in the annexes.(Annex-1 , Annex-2, Annex-3, Annex-4)

The following section contains information on the preclinical evaluation of the raw materials and the toxicological and biocompatibility tests on the sterile finished product Damacryl.(TF13 Clinical and Biological Evaluation)

1.17. Biocompatibility Tests of the Raw Materials for Medical Device Damacryl and PGA(ISO10993-1:2009)

Specific safety evaluation programs follow International Organization for Standardization (ISO) 10993 standards and Food and Drug Administration (FDA) guidance (May 1, 1995). The table below is based on ISO 10993-1 Evaluation and testing, 2009 edition. The crosses (X) indicate data endpoints that can be necessary for a biological safety evaluation per ISO 10993-1, based on a risk analysis. Where existing data are adequate, additional testing is not required. (Clinical and Biological Evaluation)

1.18. Manufacturing Process:

Manufacturing is performed at the İkitelli O.S.B İsdök Sanayi Sitesi İsdök Sosyal Tesis Plaza Binasi B Blok No :7-8. The manufacturing is made under clean room conditions. The productions consist of manually insertion of the thread into the needles. After testing products are winded in a paper, are packed into aluminium paper, then packed again in a medical paper and the products are ETO sterilized in-house.

The following major manufacturing steps are used:

Manufacturing Methods

- Threads are applied with tipping solution
- Threads are cut to the required length.
- Threads are manually attached to needles using purpose made attaching machines in ISO 8 Clean Room.

Packaging Procedures

- After attaching, the suture is reverse wound into a retaining pouch leaving the needle accessible for easy withdrawal of the thread.

b) The wound sutures are packed in an aluminum foil inner envelope (primary packaging) and labeled in ISO 8 Clean Room, but not sealed at this stage.

c) This inner aluminum envelope is then placed in an outer envelope (secondary packaging), which is sealed.

One package unit of Damacryl and PGA contains 12 single pouches.

Sterilization

Damacryl and PGA(PGA) sutures are sterilized in-house by EtO. They are then vacuum- dried, sealed and packed.

Sterilization process is verified by chemical indicators and biological indicators are also used routinely to challenge the procedure. The sterilization process is validated according to EN ISO 11135:2014. Main routine sterilization parameters are 40 °C %40 Humidity with a gas injection period of 5 hours.

As regards the manufacturing / assembly area, environmental conditions are monitored at regular intervals using standard microbiological methods (i.e. culture plates)

Drying

Damacryl and PGA sutures are dried after EtO sterilization. They are vacuum-dried using a vacuum oven (3 hours, 75°C) Then with Nitrogen washing for 12 hours and a final vacuum 5 hours and drying for another 3 hours. At the end of the drying process the aluminium packages are sealed under controlled conditions. The sutures are then boxed, 12 per box and boxes are wrapped by shrinking cover.

Packaging into cartons

Twelve sutures pouches are packed into a carton and labelled. Each carton is polyolefin wrapped. Hundred cartons are packed in a shipper, which is sealed. Each shipper is allocated a unique sequential identification number and labelled with the contents and their batch numbers.
