Extendable anaesthetic breathing systems providing a versatile solution

Designed for economy, the unique Compact™ extendable anaesthetic breathing system can be compressed to almost one fifth of its extended length. Supplied in compressed form, increasing the number of systems per box, there can be significant space and cost savings compared with other breathing systems.

A standard box of Compact™ systems could benefit a hospital by enabling more Compact™ systems per box, lower storage requirements, lower freight volume costs and improved disposal.

Compact™ and Superset™ – extendable tube

Compact breathing systems and Superset catheter mounts are made using extendable tubing. This allows the tube length to be changed to suit the clinical situation and for the tube position to be set as required, with multiple positioning possibilities ideal for head and neck surgery. The Compact systems are supplied in a compressed form which increases the number of systems per box, for more cost effective storage and disposal. This means that there can be significant space savings compared with other breathing systems.
