Lublin, Poland

Dear Valued Partners and Customers,

We confirm that GELEX aluminum boats are built using the most advanced technologies in welding, surface treatment, and protective coating.

We weld the high-strength EN AW-5083H111 aluminum alloy using both TIG and MIG methods. This guarantees exceptionally strong and monolithic hull structures capable of withstanding extreme loads and harsh marine conditions.

We apply the advanced ENVIROX passivation system with titanium. This environmentally friendly technology replaces harmful chromates and creates a robust protective layer that significantly increases corrosion resistance and extends the hull's lifespan. The system is recommended by the International Qualicoat Organization.

Our hulls are finished with premium marine-grade polyester powder coating, which provides:

Uniform and extra-durable coverage
Excellent UV and corrosion resistance
High resistance to mechanical damage
Environmentally friendly application (no VOCs).

Sincerely,

Director
Hanna Lysykhina
