

MICROSCOPY AND LABORATORY DIAGNOSTICS

Our global presence

We manufacture products for use in histopathology, hematology, cytology, and microbiology with a wide national and international distribution network present in over 70 countries.

BioGnost offers only the best quality products at competitive prices and has one of the widest ranges of medical products in South-Eastern Europe. Our experience and flexibility towards the client makes us a sought-after business partner, which has been recognized on the global market.

Our entrepreneurship started in 1990 with the founding of the family company. Accelerated business growth began in 1998 with production of blood typing serums followed by the Croatian Ministry of Health granting BioGnost the License for the manufacture of medical products. We are proud of one of our biggest successes - relocating to our new commercial and manufacturing building in 2012. The site enabled an enhanced work environment, including a carefully devised warehouse structure, segmented production facilities with increased manufacturing capacity, and additional R&D capabilities.

We continue to build on the strong momentum from last year to create high-quality products and provide excellent customer service.

Strategic priorities

Our mission is to create high-quality products and provide excellent services, as well as introduce new or expanded product lines and sales ranges in accordance with market dynamics and demands.

Product and service excellence makes BioGnost a desirable regional and international business partner. The key to success is the ever-expanding network of business partnerships, as well as recognizable social responsibility. In the coming years we plan to further our market expansion, additionally invest in research and development, and to become a competitive manufacturer in the fields of microbiological diagnostics and histopathology.

ISO 9001, ISO 13485, ISO 14001

BioGnost's entire business is in accordance with international ISO 9001, ISO 13485 and ISO 14001 standards. The company implemented ISO standards more than 15 years ago, and is the first Croatian company to implement the ISO 13485 quality system for medical devices. Having fulfilled the requirements of these standards, the company is completely in accordance with national legal regulation and the European Union's Medical Device Regulation (EU 2017/745).

CE, IVDR

BioGnost's products bear the CE mark, a certificate that confirms that the products are in accordance with the European Union's standards. They are declared as *in vitro* diagnostic medical devices (IVD) classified as "Class A" products (according to the Regulation (EU) 2017/746). No control of a Notified Body is required for this class; entire company business is in accordance with applicable regulations and standards.

OEM manufacture

Besides products from our own sales range, we also offer OEM manufacture for your company. It includes a wide range of services, such as label design, product packaging, instructions for use and certificates of analysis, and products manufactured according to your specifications.

Mounting and microscopy

Protection and preservation of stained samples generally require mounting with a suitable medium. For further examination of the sample, immersion oils are essential in providing a high resolution image during microscopical analysis at high magnification. Special cleaning solutions are used for removing oil residues from microscope lens and slides.

Mounting media

Ten different covering and mounting media for permanent preservation of microscope slides

In order to prepare permanent sections, stained samples must be covered with a suitable mounting medium. One of the most important criteria is the refractive index similar to that of glass. Other criteria include a suitable solvent, polymer and optimal viscosity. After the sample is covered and a cover glass is mounted, the section is protected from external factors and remains preserved for a prolonged period of time. BioMount media do not crack or turn yellow during sample storage.

Immersion oils

Seven different types of immersion oils for microscopical analysis

Immersion oils are essential for routine laboratory work, especially in hematology, cytology and microbiology. They are commonly used for high magnifications in order to secure high resolution and a clear image. There are several types of immersion oils that differ according to viscosity and certain properties required by different microscopy techniques. They all have a common refractive index of 1.5150, equal to the refractive index of glass.
