

INgezim® BTV Compac 2.0

R.12.BTV.K.3

Blocking ELISA for the detection of specific antibodies to protein vp7 of the Blue Tongue Virus (BTV).
Ruminant serum samples.

1 PRODUCT APPLICATION

INgezim® BTV Compac kit, has been designed for the detection of antibodies specific to vp7 protein of BTV (Blue Tongue Virus) in bovine, goat and ovine serum, plasma individual samples.

2 TECHNICAL BASIS OF THE PRODUCT

The assay is based on a blocking ELISA method, which scheme is briefly described hereunder:

1. Plates are supplied coated with BTV vp7 recombinant protein antigen. On these wells, samples are added and incubated.
2. If serum samples contain specific antibodies to BTV, they will bind the antigen.
3. At this point, a washing step is necessary to remove any non-specifically bound material.
4. When the conjugate (monoclonal antibody specific to vp7 of BTV, conjugated with HRPO) is added, only if there are no antibodies blocking the antigen (negative animals), it will bind to the antigen. In case the sample contains antibodies blocking the antigen (positive animals), the conjugate will not be able to bind to it.
5. Again a washing step is necessary after incubation with conjugate to remove material not bound to the protein.
6. When adding a specific peroxidase substrate, if the serum is negative, colorimetric reaction will appear.

3 KEY REAGENTS USED

The optimal performance of the assay is mainly due to the quality of the key reagents, which are briefly described below:

- **BTV Antigen:** protein vp7 of BTV obtained as recombinant protein.
- **Monoclonal antibody:** specific for vp7 of BTV, conjugated with peroxidase; used as capture antibody.

4 VALIDATION

4.1 AGID TECHNIQUE

In order to determine the sensitivity and specificity of the assay with respect to the AGID technique, a panel of 225 collection sera previously typified by this technique was analyzed, carried out according to the protocol described by the OIE for the diagnosis of Bluetongue.

The results obtained are shown below:

✓ **Bovine sera (95)**

		INgezim® BTV COMPAC 2.0		
(AGID)		POSITIVES	NEGATIVES	DOUBTFUL
	POSITIVES	61	3	0
	NEGATIVES	0	31	0

Specificity: True Negatives / True Negatives + False Positives (31/ 31) = 100%

Sensibility: True positives/ True Negatives + False Negatives (61/ 61+3) = 95%

✓ **Ovine sera (33)**

		INgezim® BTV COMPAC 2.0		
(AGID)		POSITIVES	NEGATIVES	DOUBTFUL
	POSITIVES	6	0	0
	NEGATIVES	1 ^a	25	1

a. These sera have DO values very close to the cut-off point.

Specificity True Negatives / True Negatives + False Positives (25/ 25+1) = 96%

Sensibility True positives/ True Negatives + False Negatives (6/ 6) = 100%

✓ **Goat sera (97)**

		INgezim® BTV COMPAC 2.0		
(AGID)		POSITIVES	NEGATIVES	DOUBTFUL
	POSITIVES	5	0	0
	NEGATIVES	0	92	0

Specificity True Negatives / True Negatives + False Positives (92/ 92) = 100%

Sensibility True positives/ True Negatives + False Negatives = 100%

4.2 REFERENCE SERA

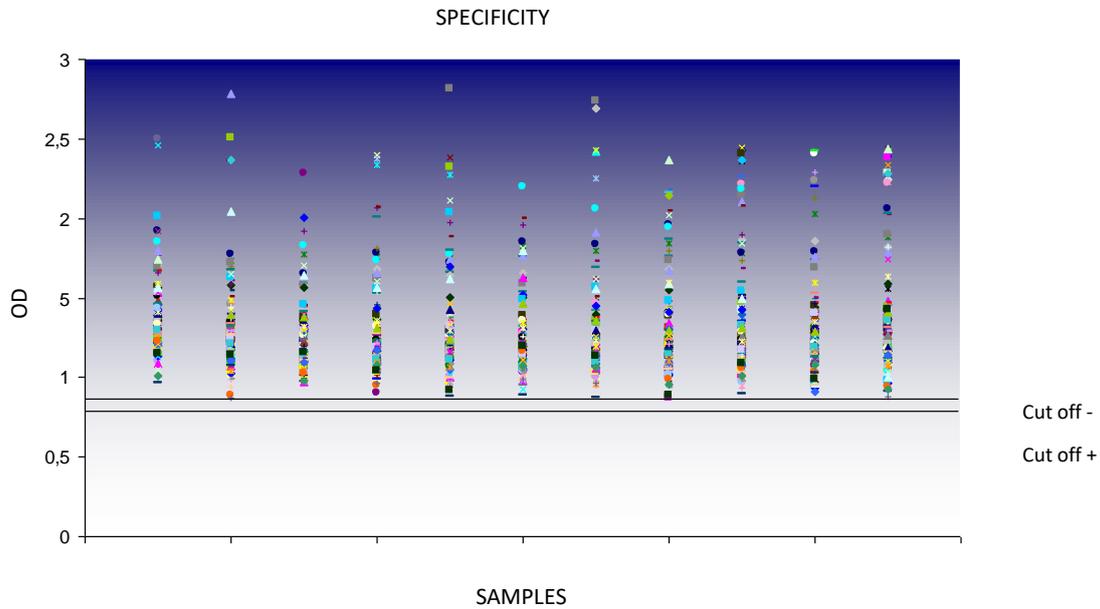

Sera from animals infected with all 24 BTV serotypes have been analyzed. These sera have been obtained from the different Reference Laboratories for BTV (Central Veterinary Laboratory of Algete, Pirbright Laboratory, USDA and Onderstepoort) and the obtained results have been compared with the two possible incubation options in the kit.

A slight increase in sensitivity was observed when using the option of incubation 18-24 hours at room temperature in those cases of sera with minimal antibody titers.

4.3 SPECIFICITY ASSAY

In order to determine the specificity of the test in field samples, 1262 sera (92 sheep, 92 goats and 1078 cattle) from Spanish farms free of BTV have been analyzed. The results indicate a specificity of the assay >99.9%.

4.4 SENSITIVITY OF THE ASSAY

In order to determine the sensitivity of the test, a panel of samples from 8 positive farms was analyzed. The results were compared with those obtained by another commercially available immunoassay (commercial EIA).

The following tables show a summary of the study conducted.

- **FARM 1 (88 sera)**

		INgezim® BTV COMPAC 2.0		
		POSITIVES	NEGATIVES	DOUBTFUL
EIA	POSITIVES	37	0	0
	NEGATIVES	8 ^a	42	1

a. 5 of these sera gave results close to the cut-off point by INgezim BTV COMPAC 2.0

- **FARM 2 (86 sera))**

		INgezim® BTV COMPAC 2.0		
		POSITIVES	NEGATIVES	DOUBTFUL
EIA	POSITIVES	29	0	0
	NEGATIVES	4 ^a	53	0

a. 2 of these sera gave results close to the cut-off point of the external kit

- FARM 3 (87 sera))

		INgezim® BTV COMPAC 2.0		
EIA		POSITIVES	NEGATIVES	DOUBTFUL
	POSITIVES	19	0	0
	NEGATIVES	3 ^a	64	1

a. 1 serum with OD value equal to the cut-off point for the external kit.

- FARM 4 (86 sera))

		INgezim® BTV COMPAC 2.0		
EIA		POSITIVES	NEGATIVES	DOUBTFUL
	POSITIVES	12	1	0
	NEGATIVES	3 ^a	70	0

a. 2 sera have DO values close to the cut-off point for the external kit.

- FARM 5 (76 sera))

		INgezim® BTV COMPAC 2.0		
EIA		POSITIVES	NEGATIVES	DOUBTFUL
	POSITIVES	35	0	0
	NEGATIVES	10 ^a	31	0

a. 8 sera have OD values close to the cut-off point for the external test.

- FARM 6 (96 sera)

		INgezim® BTV COMPAC 2.0		
EIA		POSITIVES	NEGATIVES	DOUBTFUL
	POSITIVES	52	1	0
	NEGATIVES	0	43	0

- FARM 7 (53 sera)

		INgezim® BTV COMPAC 2.0		
EIA (commercial)		POSITIVES	NEGATIVES	DOUBTFUL
	POSITIVES	26	2	0
	NEGATIVES	4	21	0

- FARM 8 (92 sera))

		INgezim® BTV COMPAC 2.0		
EIA		POSITIVES	NEGATIVES	DOUBTFUL
	POSITIVES	13	0	0
	NEGATIVES	0	79	0

4.4.1 Sensitivity with field samples

A total of 172 samples previously characterized as positive were analyzed. Of all of them, only one gave a doubtful result, the rest being positive. Therefore, the sensitivity of the assay with field samples is 99.4%.

4.4.2 Sensitivity in experimental tests

In order to determine the sensitivity of the assay, different extractions from 6 animals not vaccinated and experimentally infected with BTV serotype 4 at day 0 were analyzed.

The results of INgezim BTV COMPAC 2.0 were compared with those obtained with INgezim® BTV COMPAC, showing an increase in sensitivity of version 2.0 in 3 of the 6 animals, with detection of antibodies one day earlier than with the previous version.
