

A close-up photograph of a surgical needle and suture thread. The needle is metallic and curved, with a sharp point. The suture thread is purple and passes through the needle's eye. The background is a vibrant blue with abstract, flowing white and light blue curved lines that create a sense of motion and depth.

BioSintex

LEADING SURGICAL SUTURE

PRODUCT CATALOGUE

INTRODUCTION

HISTORY

BIOSINTEX was founded in 2002, with the aim of protecting people's health and taking part in saving human lives.

BIOSINTEX is the only local manufacturer of surgical sutures and the domestic market leader, but also an important exporter of sutures worldwide.

The company produces surgical sutures in a wide range of types and sizes, with or without needle, by using next-generation technology, high quality raw materials, certified by prestigious certification bodies.

Our portfolio also includes surgical prosthesis for soft tissue, surgical meshes for urinary incontinence and surgical reusable gowns. BIOSINTEX team devotes itself to a successful implementation of a quality control system by continuously testing the technical and quality parameters throughout the whole production flow.

Our performance has constantly increased to meet the growing demands of our customers.

HUMAN INVESTMENT

We are helped by people every day and we work towards helping others in return.

We mainly address patients, whose trust in the medical system we want to increase, as we consider this the only way to reach a higher level of quality in terms of healthcare services and the satisfaction of the involved parties.

We pay special attention to our employees, their expectations and their professional training and development, in order to fulfill the very dynamic needs of medical personnel worldwide.

We have built a valuable organization that provides for both the patients and physicians performant medical solutions, under optimal safety conditions, together in a partnership based on mutual trust and openness to cooperation.

INFRASTRUCTURE

BIOSINTEX's manufacturing facility is located in Snagov, in the neighborhood of Bucharest. Lying on 1,400 sqm of built area, including production plant, warehouses, and offices, the unit in Snagov uses latest generation technology and the production area complies with ISO 14644-1: 1999 international standard referring to clean rooms and associated controlled environments. According to this standard, production areas classify at ISO Class 8, and according to the American standard FDA-US 209 E, they classify under Class D – Clean rooms.

A clean room is a production area controlled in terms of air filtering and ventilating system, which provides constant concentration of particles inside the clean rooms and reduces particle generation by keeping them inside and maintaining constant parameters such as air temperature, humidity, pressure and purity.

Through this renowned and ample procedure we comply with the European regulations that refer specifically to the production of medical devices.

QUALITY

As main objective, Biosintex aims to provide products and services competitive in terms of quality and safety.

Biosintex successfully belongs to the family of European producers and distributors of medical devices, by complying with the following applicable standards and legal norms:

- Directive 93/42/EEC on medical devices with subsequent modification, transposed into HG No. 54/2009, regarding the rules of placing medical devices on the market
- ISO 9001:2008 (SR EN ISO 9001:2008) Quality management systems - Requirements
- ISO 13485:2003 (SR EN ISO 13485:2012) Medical devices - Quality management systems - Requirements for regulatory purposes

Sterile surgical sutures, surgical prosthesis for soft tissues and surgical meshes for urinary incontinence produced by BIOSINTEX, are classified according to 93/42/EEC with all further modification (HG45/2009) annex IX, as follows:

Ref. no.	PRODUCT DESCRIPTION	CLASS
1	BICRIL, polyglycolic acid, coated, synthetic absorbable suture	III
2	BICRIL 910, 90% glycolide acid and 10% L-lactide, coated, synthetic absorbable suture	III
3	BICRIL RAPID, polyglycolic acid, coated, synthetic rapid absorbable suture	III
4	PDO  , polydioxanone, synthetic absorbable suture	III
5	PDO  ANCHOR, polydioxanone, unidirectional/bidirectional, synthetic absorbable suture	III
6	MONO  , 75% polyglycolide and 25% caprolactone, synthetic medium absorbable suture	III
7	BIOPRO, polypropylene, synthetic non-absorbable suture	III
8	BIOSTER, polyester, coated, synthetic non-absorbable suture	IIb
9	BIOSILK, silk, coated, natural non-absorbable suture	IIb
10	NYLON MULTI, polyamide (nylon 6.6), coated, synthetic non-absorbable suture	IIa
11	NYLON MONO, polyamide (nylon 6.6), synthetic non-absorbable suture	IIa
12	HERNI PRO, polypropylene, non-absorbable mesh	IIb

SURGICAL NEEDLES

Surgical needles used to manufacture sutures with needles are made of surgical steel and are available in a variety of types, shapes, lengths and diameters. Selection of suitable needle is made only by the surgeon, who takes into consideration features such as: surgical procedure, tissue to be sutured or accessibility to wound.

The needle is an essential component of the suture, and in some degree, is one of the essential conditions of the success suture.

✓ **Silicone needle coating permits easier tissue passage – to improve precision and penetration.**

The coating helps reducing the force needed to make initial tissue penetration and the frictional forces as the body of the needle passes through the tissue.

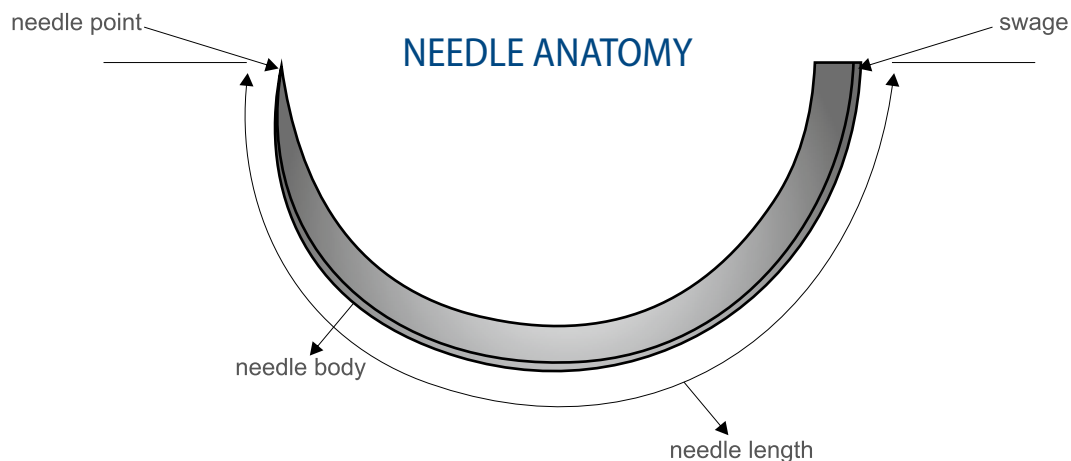

✓ **Corrosion resistant – the needles are made of high quality stainless steel**

The needle containing a minimum of 12% chromium, which creates passive state film by combining with oxygen to prevent corrosion.

✓ **Sharpness – sharp point** – to penetrate and carry suture through tissue with minimal resistance

Surgical needles are made from hard fiber stainless steel alloy for ductility and bending strength, allowing optimal security when suturing.

✓ **Stable in the needleholder.**

Needle point Needle points can be almost blunt, round or cutting.

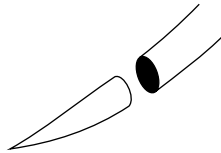

Needle body Section of needle is a rectangular shape with flat corners on the gripping area which ensures stability in the
 **Flat** needle holder.

Attachment area A hole is drilled into the end of the wire and the suture is attached into this hole. Needles are laser drilled, which provides a smooth transition between needle and material thus reducing tissue trauma.

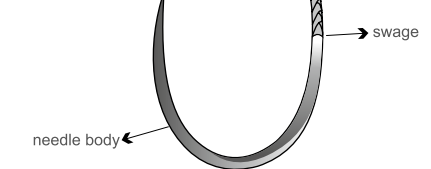

USE OF SURGICAL NEEDLES

USE OF NEEDLE - HOLDER

1. The needle holder should be carefully selected to match the size and strength of the needle to be used, since it may easily damage the needle during its passage through the tissue. For example, a needle holder larger than required may cause the distortion of the needle's curvature.
2. The good condition of the needle holder is essential in the proper functionality of the needle. For example, worn jaws of the needle holder may lead to the needle rotation and instability in the needle holder. As well, the presence of some irregularities on the needle holder jaws may cause the loss of strength of the needle.
3. Grasp securely the needles on the needle holder jaws, closer to the tip of the jaws.
4. Needles should be grasped in the flattened area located in the third part ($1/3$) to one-half ($1/2$) toward the swage area. Do not grasp the needle near to the suture's attachment area (swage area) or to the needle point. Excessive force should not be applied when gripping the needle, particularly with Tungsten Carbide jaw inserts, as this may damage the needle body and cause loss of strength or breakage.

PACKAGING AND LABELLING

The essential information for proper use is indicated on the medical devices packaging, as symbols according to ISO 15223-1:2012 "Medical devices - Symbols to be used with medical device labels, labelling and information to be supplied - Part 1: General requirements".

Do not re-use

Do not use if package is damaged

Consult instructions for use

Caution

Sterilized using ethylene oxide

Do not re-sterilize

SURGICAL PRODUCTS

Material	Synthetic suture made of polyglycolic acid
Structure	Multifilament braided
Coating	Polycaprolactone and calcium stearate coating
Available Sizes(USP)	6/0 ÷ 3&4
Tensile strength	Preserves more than 65% of the initial tensile strength after 14 days at 37°C
Absorption	Absorbable Completely between 60- 90 days post-implant
Properties	Synthetic suture that preserves its properties regardless of tissue condition, having a minimal tissular reaction. Absorption is done by hydrolysis and not by enzymatic digestion as biological sutures (catgut). Thus, the absorption time is constant regardless of the tissue or of the suture's size. Soft, with safe & easy knot tie down due to the braided structure, but atraumatic and with a smooth passage through the tissues due to its external coating which makes it a virtual monofilament.
Features	Colour: violet or undyed (natural) Sterilised EO Available as ligature and atraumatic suture with needle Different lengths

Synthetic, multifilament, absorbable suture

BICRIL 910

BICRIL 910

Synthetic, multifilament, absorbable suture

Material	Synthetic suture made of 90% glycolide and 10% L- lactide
Structure	Multifilament braided
Coating	Poly (glycolide-co-L-lactide) 30:70 and Calcium stearate coating
Available Sizes(USP)	5/0÷2
Tensile strength	Preserves more than 65% of the initial tensile strength after 14 days at 37°C
Absorption	Absorbable Completely between 60 - 80 days post-implant
Properties	Synthetic suture that preserves its properties regardless of tissue condition, having a minimal tissular reaction. Absorption is done by hydrolysis and not by enzymatic digestion as biological sutures (catgut). Thus, the absorption time is constant regardless of the tissue or of the suture's size. Soft, with safe & easy knot tie down due to the braided structure, but atraumatic and with a smooth passage through the tissues due to its external coating which makes it a virtual monofilament.
Features	Colour: violet or undyed (natural) Sterilised EO Available as ligature and atraumatic suture with needle Different lengths

Synthetic, multifilament, rapid absorbable suture

Material	Synthetic suture made of polyglycolic acid
Structure	Multifilament braided
Coating	Polycaprolactone and calcium stearate coating
Available Sizes(USP)	5/0÷2
Tensile strength	Preserves more than 45% of the initial tensile strength after 7 days at 37°C
Absorption	Rapid Absorbable Completely between 42- 63 days post-implant
Properties	Synthetic suture that preserves its properties regardless of tissue condition, having a minimal tissular reaction. Absorption is done by hydrolysis and not by enzymatic digestion as biological sutures (catgut). Thus, the absorption time is constant regardless of the tissue or of the suture's size. Soft, with safe & easy knot tie down due to the braided structure, but atraumatic and with a smooth passage through the tissues due to its external coating, which makes it a virtual monofilament.
Features	Colour: undyed (natural) or violet Sterilised EO Available as ligature and atraumatic suture with needle Different lengths

Synthetic, monofilament, absorbable suture

Material	Synthetic suture made of polydioxanone
Structure	Monofilament
Available Sizes(USP)	6/0÷2
Tensile strength	Preserves more than 60% of the initial tensile strength after 28 days at 37°C
Absorption	Slowly Absorbable Completely between 180-220 days post-implant
Properties	Synthetic suture that preserves its properties regardless of tissue condition, having a minimal tissular reaction. Absorption is done by hydrolysis and not by enzymatic digestion as biological sutures (catgut). Thus, the absorption time is constant regardless of the tissue or of the suture's size. Smooth and atraumatic passage through the tissues, due to its monofilament structure.
Features	Colour: violet Sterilised EO Available as ligature and atraumatic suture with needle Different lengths

Synthetic, monofilament, medium absorbable suture

Material	Synthetic, copolymer consisting of 75% polyglycolide and 25% caprolactone
Structure	Monofilament
Available Sizes(USP)	5/0÷2
Tensile strength	Preserves 50% of the initial tensile strength after 7 days at 37°C
Absorption	Medium absorbable Completely between 90 - 120 days post-implant
Properties	Synthetic suture that preserves its properties regardless of tissue condition, having a minimal tissular reaction. Absorption is done by hydrolysis and not by enzymatic digestion as biological sutures (catgut). Thus, the absorption time is constant regardless of the tissue or of the suture's size. Soft, with safe knot tie down, but atraumatic and with a smooth passage through the tissues, due to its monofilament structure. Minimal inflammatory tissue reaction.
Features	Colour: violet or undyed (natural) Sterilised EO Available as ligature and atraumatic suture with needle Different lengths

Synthetic, monofilament, medium absorbable suture

SURGICAL SUTURE WITHOUT NEEDLES

Material	Synthetic, monofilament, non-absorbable suture
Structure	Monofilament
Available Sizes(USP)	7/0÷2
Properties	Synthetic suture that preserves its properties regardless of tissue condition, having a minimal tissular reaction. Polypropylene suture is the most inert suture material. Non-absorbable, which allows sustained support of the wound. Smooth and atraumatic passage through the tissues, due to its monofilament structure.
Features	Colour: blue or undyed (white) Sterilised EO Available as ligature and atraumatic suture with needle Different lengths

Synthetic, monofilament, non-absorbable suture

Synthetic, multifilament, non-absorbable suture

Material	Synthetic suture made of polyester
Structure	Multifilament braided
Coating	Waxed or siliconed coating
Available Sizes(USP)	5/0÷5
Properties	Synthetic suture that preserves its properties regardless of tissue condition, having a minimal tissular reaction. Non-absorbable, which permits sustained support for the wound. Soft, with safe & easy knot tie down due to the braided structure, but atraumatic and with a smooth passage through the tissues due to its external coating which makes it a virtual monofilament. It may need an additional knot for security.
Features	Colour: green (or white) Sterilised EO Available as ligature and atraumatic suture with needle Different lengths

Synthetic, multifilament, non-absorbable suture

Material	Biological suture made of natural silk
Structure	Multifilament braided
Coating	Waxed or silicone coating
Available Sizes(USP)	5/0÷2
Properties	Biological suture made of natural silk. While silk sutures are not absorbed, progressive degradation of the silk fibers in vivo may result in gradual loss of the suture's tensile strength over time. Soft, with safe & easy knot tie down due to the braided structure, silk suture is the malleability standard for sutures. At the same time, coated silk is atraumatic and with a smooth transition through the tissues due to its external coating which makes it a virtual monofilament.
Features	Colour: black Sterilised EO Available as ligature and atraumatic suture with needle Different lengths

NYLON MULTI

Synthetic, multifilament, non-absorbable suture

Material	Synthetic suture made by polyamide (nylon 6.6)
Structure	Multifilament braided
Coating	Waxed or silicone coating
Available Sizes(USP)	5/0÷2
Properties	Synthetic suture that preserves its properties regardless of tissue condition, having minimal tissular reaction. While Nylon Multi sutures are not absorbed, progressive hydrolysis in vivo may result in gradual loss over time of tensile strength. Structure which offers excellent flexibility of suture. Soft, with safe & easy knot tie down due to the braided structure, but atraumatic and with a smooth passage through the tissues due to its external coating which makes it a virtual monofilament.
Features	Colour: white (black or blue upon request) Sterilised EO Available as ligature and atraumatic suture with needle Different lengths

Synthetic, multifilament, non-absorbable suture

NYLON MONO

Synthetic, monofilament, non-absorbable suture

Material	Synthetic suture made by polyamide (nylon 6.6)
Structure	Monofilament
Available Sizes(USP)	6/0÷2
Properties	Synthetic suture that preserves its properties regardless of tissue condition, having minimal tissular reaction. While Nylon Mono sutures are not absorbed, progressive hydrolysis in vivo may result in gradual loss over time of tensile strength. Smooth and atraumatic passage through the tissues due to its monofilament structure as well as due to uniform diameter of suture. Minimal memory of suture and excellent flexibility due to structure of suture.
Features	Colour: white (or blue or black) Sterilised EO Available as ligature and atraumatic suture with needle Different lengths

SURGICAL PRODUCTS

HERNI PRO

HERNI PRO

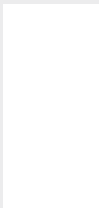

Surgical prosthesis for soft tissues

Description	Herni Pro is a surgical prosthesis designed for repair of/reinforcement of hernia or other defects that require a non-absorbable implant support.
Material	100% monofilament non-absorbable polypropylene suture
Features	Inert prosthesis that reduces the risk of topic infection Transparent Resistant Can be easily adapted to body's shape Area of use: hernia and incisional hernia Variable size, thickness and porosity variable according with type of meshes Shape: knitted material in rectangular shape and different pre-cut form Adjustable: the mesh can be cut according with size and condition of her-nia/ incisional hernia without falling apart. Sterile packed. Sterilised EO
