Heart and blood vessel disorders are collectively referred to as cardiovascular disease (CVD). The development of fatty deposits inside the arteries (atherosclerosis) and a higher risk of blood clots are typically connected with it. Damage to the arteries in several organs, including the kidneys, eyes, heart, and brain, can also be linked to CVD. A healthy lifestyle can frequently greatly reduce the risk of developing it. The four main CVD diseases are coronary heart disease, strokes and transient ischemic attacks (TIAs), peripheral arterial disease, and aortic disease. CVD is one of the leading causes of death and disability worldwide.
