# leadercath 2 - PUR

## Single lumen catheter leadercath

leadercath 2 is a totally radiopaque polyurethane catheter inserted in the femoral, jugular or subclavian veins using the Seldinger technique.

The catheter consists of an extension tube of 25 cm with lipid-resistant 3-way stopcock. This extension tube features an inner layer in polyethylene which is an inert material with good compatibility with most drugs. This reduces the risks of interactions such as adsorption, absorption, migration of plasticizers.

Guidewire: Stainless Steel
