

System composition

Management scheme 1

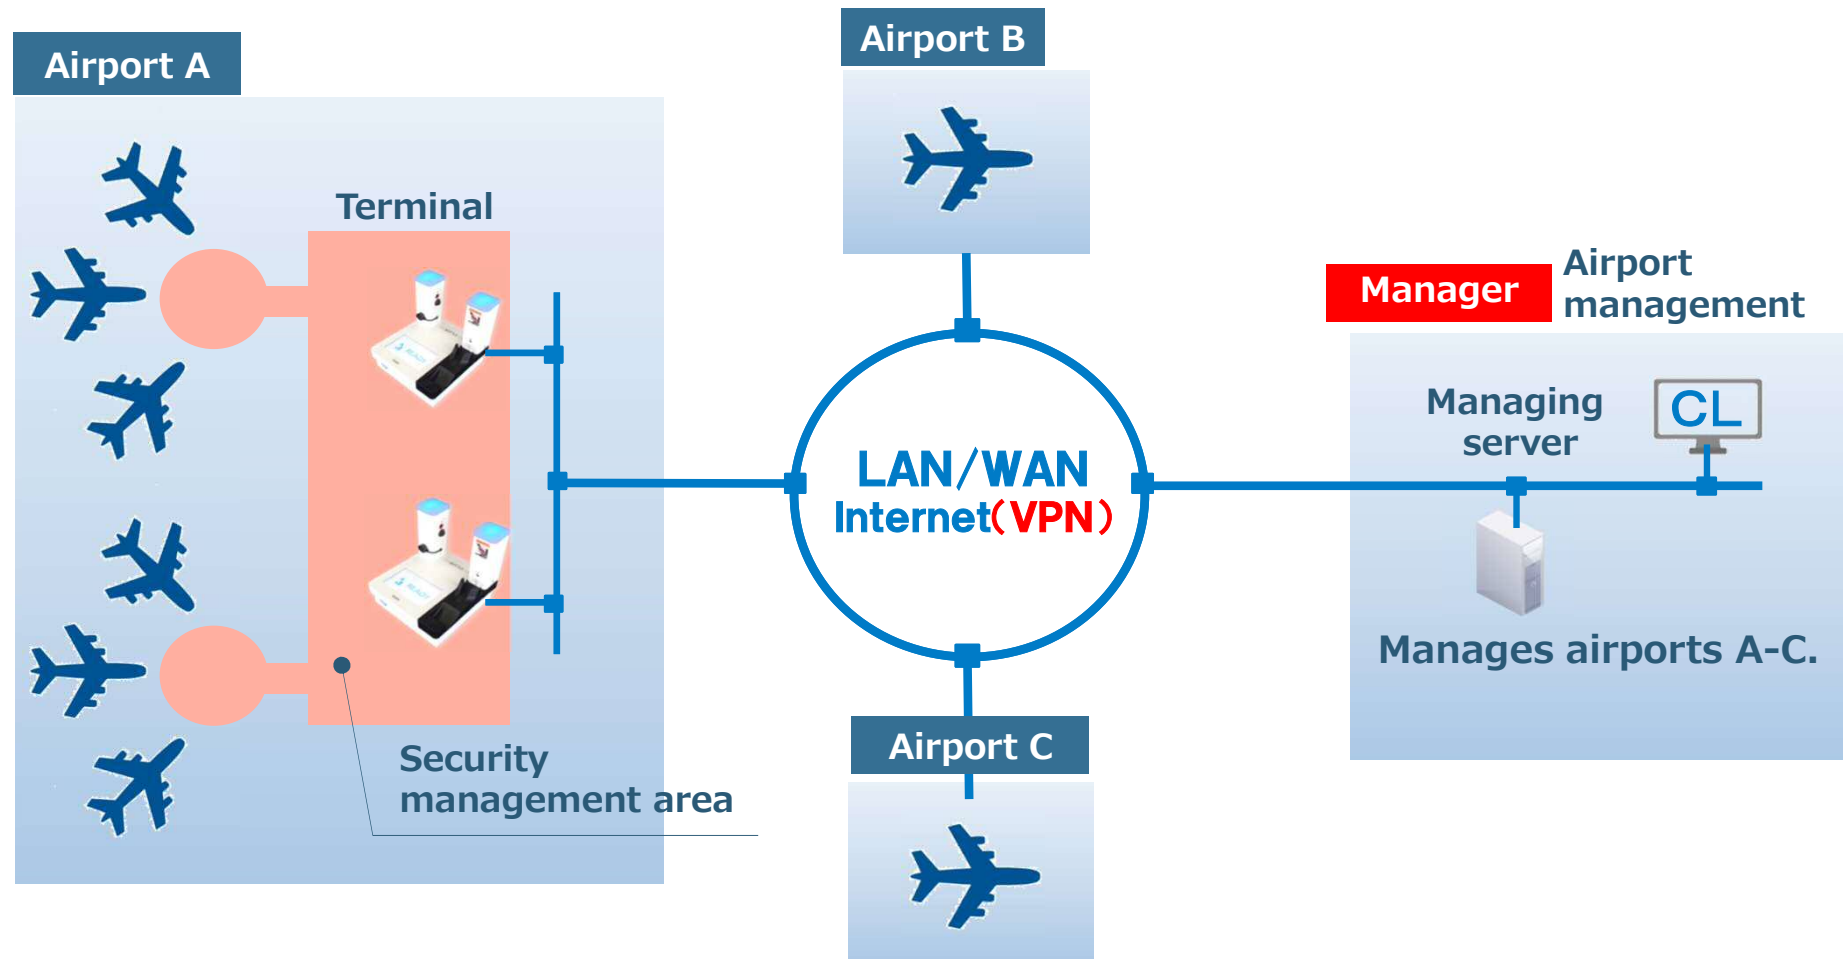

- A manager at one airport controls one or more devices installed only at his airport. So, if there are two airports and you are going to install two devices at each airport, each manager checks two devices only at each airport, separately. In that case, you need two management software to manage the devices separately.

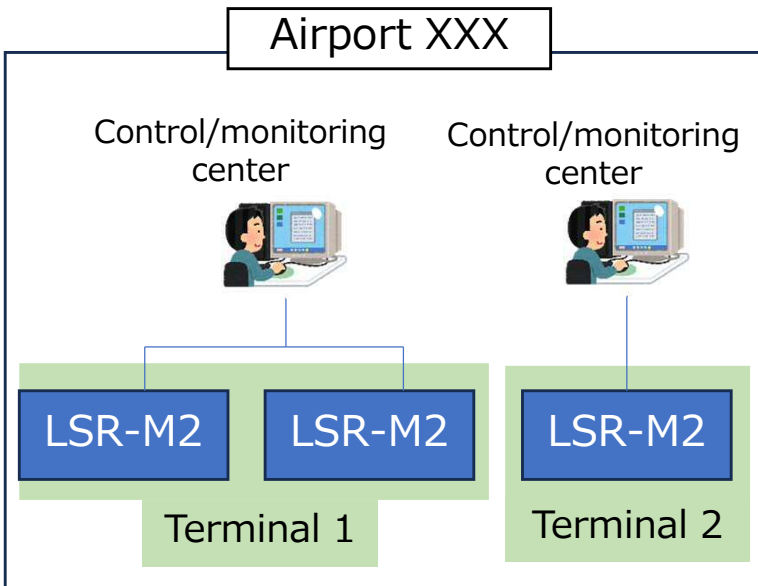

- Moreover, as long as the airport use the management software, a license is required for each LSR-M2 device connected to the management software.
In the above case, you will need to purchase 4 (four) licenses to use two management software.

Management scheme 2

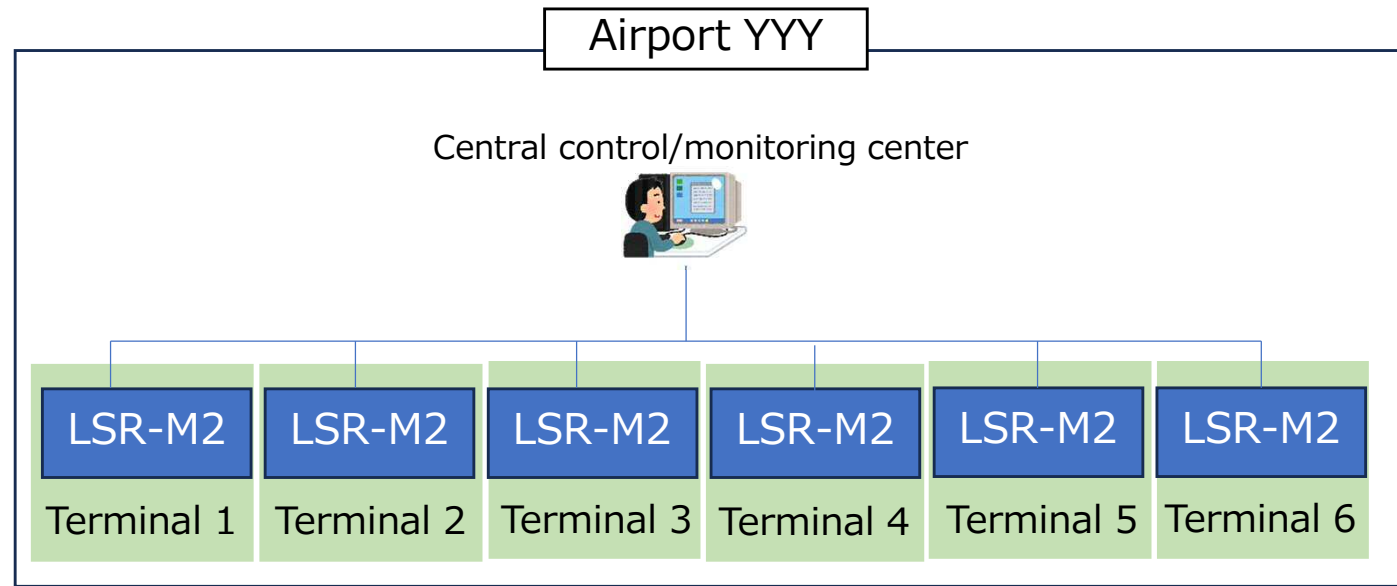

- A manager at a separated location controls all the devices in all the airports in your country. In this case, devices in all the airports should be connected to by LAN/WAN. You need only one software.

Examples for understanding the number of needed licenses and software

- Number of License needed: 3 pcs.
- Number of Security Check Management Software needed: 2 pcs.

- Number of License needed: 6 pcs.
- Number of Security Check Management Software needed: 1 pc.

When the airport does not use the Security Management Software, they don't need the software and its license.
