INHALATION

Our quality inhalers operate on the principle of spraying aerosol particles of medicines or salt water (physiological saline) into our respiratory system or dedicated space.

Inhaler with ultrasound effect transforms saline, minerals or prescribed medicines to micron aerosol particles which penetrate by inhalation deep into the small airways and through the sacs of the lung into the bloodstream.

Inhalations help to clean the mucus out of airways and with restoration of mucosa system. They stimulate the immune defence of the body.

We recommend them for people with asthma, respiratory allergies and diseases by acute or chronic respiratory damage, recovering from viral and bacterial infections of airways, all the people who are coming from contaminated cities, smokers and all those who have problem with too dry or too often inflamed mucosa. Inhalations can be used for hygiene and cleaning loaded mucus from respiratory mucosa, or as prevention for our healthy airways.
