

SECURE

Information Protection, Data Governance

Today's organizations face information protection challenges like never before. With the increasing amount of sensitive information traveling across various environments and being stored on an ever growing array of end-point devices such as laptops, USB devices, email and other file operations, organizations are left wide open to data breaches. In fact, U.S. businesses lose over \$12 billion per year due to data loss incidents - with more than 70% occurring internally.

PROACTIVE ENFORCEMENT VS REACTIVE FALLOUT

Just locking down users is no longer the answer. SECURE not only locks down users but also blocks user activity containing sensitive content. Understanding how your users work today, allows our security experts to help recommend the appropriate security policies to be implemented, so you will be preventing the breach from occurring rather than reacting to the breach after it happened.

Enterprise-wide users are tracked, as shown above, based on these actions, information regarding alerts are shown via priority, top alerts and top violators. SECURE prevents insider threats through end-point, file and web filtering protection.

COMPLETE PROCESS AUTOMATION

SECURE is a comprehensive, easy to use problem diagnostic solution. The solution provides unparalleled vision into what a user does to cause and application to fail. The ability for the solution to track what the user does at the desktop gives you the ability to answer the day old question, "What did you do to cause the problem?"

COMPLETE 24x7 DESKTOP COVERAGE

Easy to install. Easy to deploy. Easy to implement. Easy to manage. Agent software is installed enterprise wide on corporate laptops and desktop computers. Through the management console your organization will capture and record events at the desktop level providing insight to the end user's activities.

AUTOMATED REAL-TIME ALERTING & REPORTING

The Scribe Management Suite (SMS) provides comprehensive customizable and automated reporting to assist management in identifying productivity concerns. Organization's need the ability to collect, store and extract data to make intelligent decisions around what is happening now. Reports deliver graphical analysis and history of all user and application behavior.
