Expert opinion

Activity of desderman care against BVDV according to the Guideline of DVV/RKI dating 01.12.2014

This expert opinion is based on the test report S15L0129B.U dating 13.05.2015.

The virus-inactivating properties of the hand disinfectant desderman care of Schülke & Mayr GmbH against BVDV strain NADL were investigated by a quantitative suspension test according to the Guideline of the Deutsche Vereinigung zur Bekämpfung der Viruskrankheiten e.V. (German Association for the Control of Virus Diseases) and of the Robert Koch-Institute (RKI).

According to this Guideline, a disinfectant or a disinfectant solution at a particular concentration is considered as having virus-inactivating properties if within the recommended exposure period the titre is reduced by $\geq 4 \log_{10}$ (inactivation $\geq 99.99\%$).

desderman care was examined undiluted at 20 °C. 15 and 30 seconds were chosen as exposure times. The virus titre was decreased by $\geq 4 \log_{10}$ steps after 15 seconds in all assays. Therefore, a virucidal activity against BVDV was measured as follows:

Dr. Jochen Steinmann
