MEDIACLAVE Fast, reproducible and safe media sterilization

MEDIACLAVE – fast, reproducible and safe media sterilization

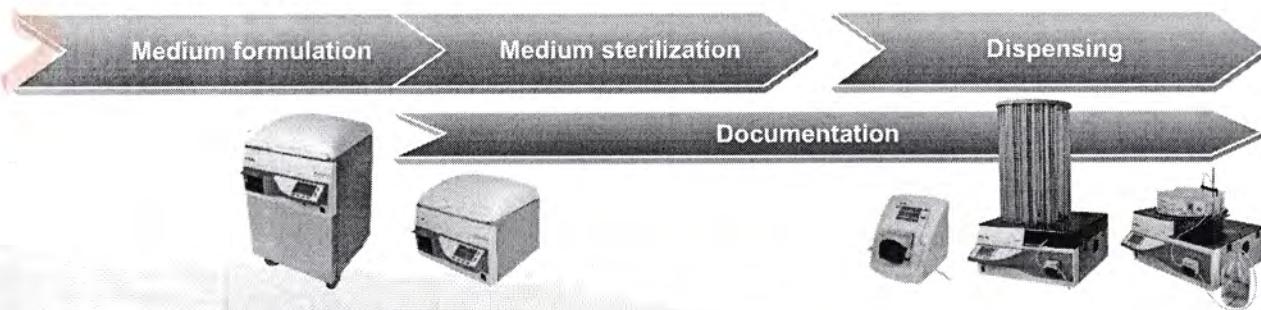

High quality medium for the cultivation of bacteria is at the core of various routine applications in today's laboratories. Hence, many downstream tasks and results directly depend on the performance of media preparation. Furthermore, an efficient process flow is important. This not only allows laboratories to save labour costs, but also frees manpower for less repetitive tasks.

The MEDIACLAVE product range is designed to approach these needs. It allows the rapid and gentle sterilization of 1 – 30 L culture medium. Precise controlling and monitoring of tem-

perature, time and pressure during the sterilization process guarantee constant high quality. The intuitive graphical user interface and the simple programming make it very easy for everyone to operate MEDIACLAVE.

MEDIACLAVE allows you to be flexible – culture medium of high quality is rapidly available whenever needed. This minimises the needed storage room, eliminates the management of shelf life time and therefore guarantees constant high medium quality.

Process for media preparation:

Medium formulation

MEDIACLAVE is quickly set up. Insert the cuvette (container for media), fill in the coupling water (water jacket between the cuvette and the vessel for efficient heat transfer) and you are ready to prepare your culture medium.

Culture medium can be suspended and dissolved directly within MEDIACLAVE. The strong magnetic stirrer guarantees homogeneous mixing within the vessel and prevents coagulation. Alternatively, culture medium can be dissolved and pre-swelled using the WATER BATH operation mode prior to sterilization.

The intuitive, multilingual graphical user interface makes it very easy for everyone to use MEDIACLAVE – no special training of the staff is required.

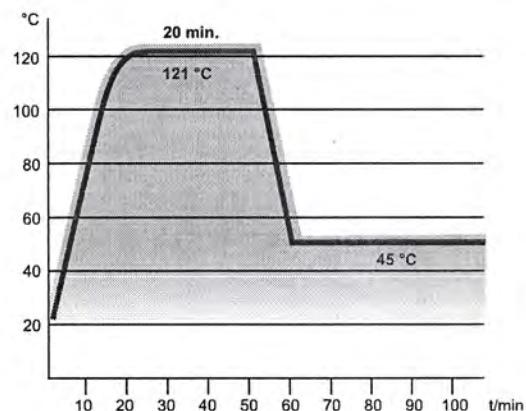

Up to 50 programs with user-defined parameter settings such as sterilization temperature, sterilization time or dispensing temperature can be saved and recalled.

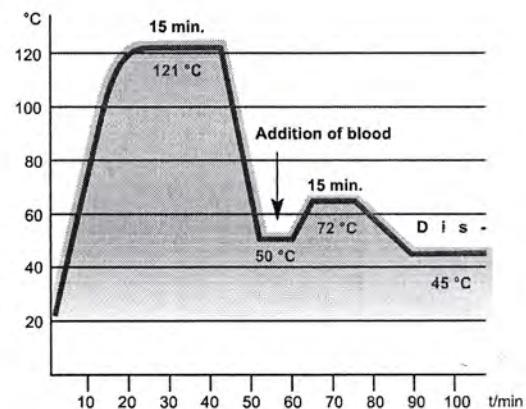

Operation modes:

Two main operation modes for media preparation, plus two extra modes can be selected and the parameters set to your needs:

- 1. STANDARD mode:** For the preparation of standard and highly sensitive culture media. Sterilization temperature/time and dispensing temperature can be set.
- 2. CHOCOLATE AGAR mode:** A special two-step program that allows the preparation of complex media. After the first sterilization phase, supplement, e.g. blood, can be added through the adding port. Subsequently, a second heating phase will be performed.
- 3. WATER BATH mode:** For pre-swelling culture media prior to sterilization within the temperature range 30 – 80°C. In combination with an autoclave cuvette (only MEDIACLAVE 10), liquids in glassware can be thermostatted.
- 4. AUTOCLAVE mode (MEDIACLAVE 10 only):** MEDIACLAVE 10, together with an optional autoclave kit can be used as a bench top autoclave for the sterilization of small amounts of culture media in glassware such as Erlenmeyer flasks or test tubes.

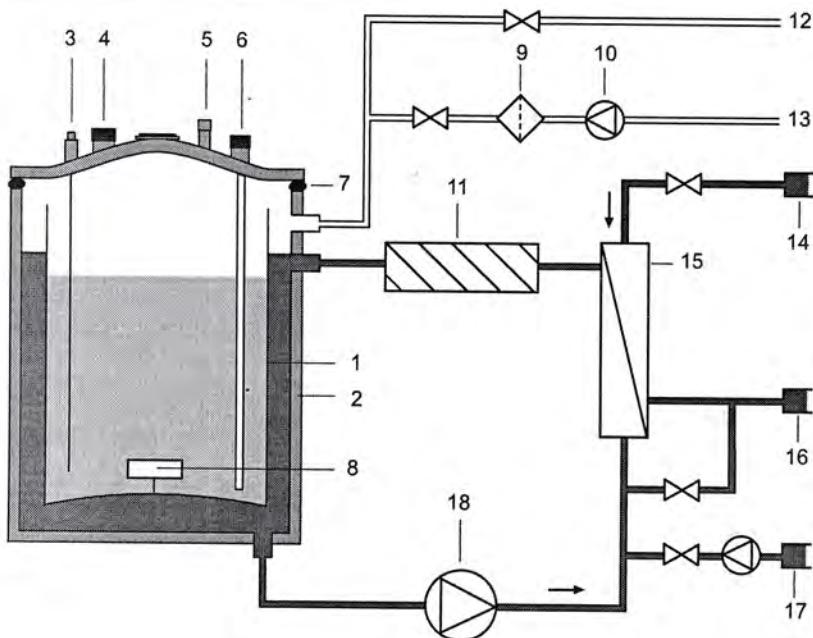

Standard mode: Heating up, sterilization and cooling down to dispensing temperature.

Chocolate Agar mode: After the first sterilization phase, blood is added and again shortly heated up before dispensing.

Medium sterilization

MEDIACLAVE working principle

- 1 Media cuvette
 - 2 Sterilization vessel
 - 3 Temperature probe
 - 4 Adding port
 - 5 Overpressure safety valve
 - 6 Dispense port with decanting tubing
 - 7 Lid seal
 - 8 Magnetic stirrer bar
 - 9 Sterile filter
 - 10 Support pressure pump
 - 11 Flow heater
 - 12 Degaeration outlet
 - 13 Air inlet
 - 14 Quick connection for cooling water inlet
 - 15 Heat exchanger
 - 16 Quick connection for water outlet
 - 17 Quick connection for coupling water inlet (MEDIACLAVE 30 only)
 - 18 Circulation pump
- ▷ Valve

MEDIACLAVE guarantees gentle and rapid sterilization of standard and highly sensitive culture media. An efficient heating and cooling system, together with homogenous mixing, minimise thermal stress during the process and therefore guarantee maximum media fertility.

High Operational Safety

An automatic tightness check at the beginning of each sterilization cycle prevents the instrument from starting if, for example, the lid seal of the vessel is not inserted properly – avoiding incomplete sterilization and subsequent media rejection. Furthermore, MEDIACLAVE is equipped with several independent monitoring systems for pressure and temperature, guaranteeing highest safety standards for the user and the working environment. The vessel lid is equipped with an autonomous overpressure safety valve and a burst disc in case all other electronic monitoring systems fail.

Fast Heating

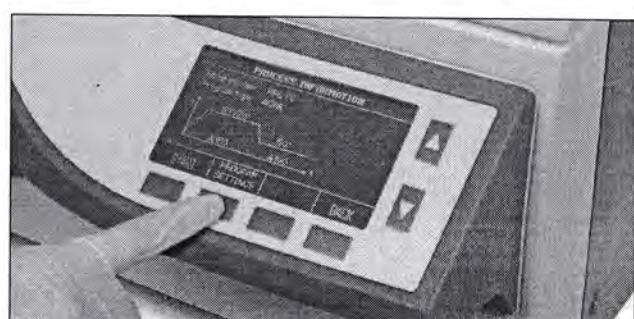

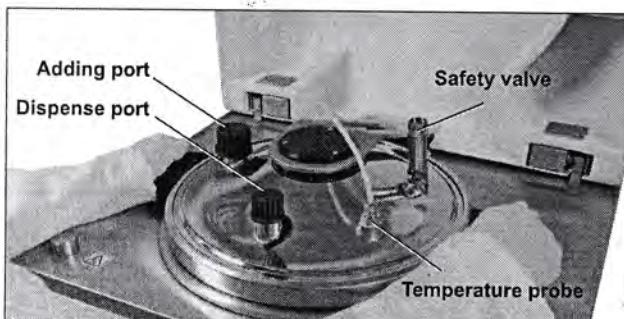

Powerful heating elements permit fast media processing. This minimises thermal stress and ensures high fertility of your culture media. Pressure and temperature controlled degaeration guarantees saturated steam in the vessel – an absolute must for complete sterilization.

Reliable Sterilization

The large and strong magnetic stirrer with adjustable speed and reversing rotation direction ensures homogenous media preparation over a wide viscosity range. A Pt-1000 temperature probe and microprocessor control of all relevant process parameters allow reliable and complete sterilization of culture media.

Rapid Cooling

Rapid cooling is enabled by an efficient plate heat exchanger. The spatial separation of the cooling water system and the sterilization chamber makes it virtually impossible that culture media will get contaminated by cooling water. The built-in support pressure system prevents a delay in boiling during the rapid cool down phase and thereby allows an extraordinary fast and gentle cooling.

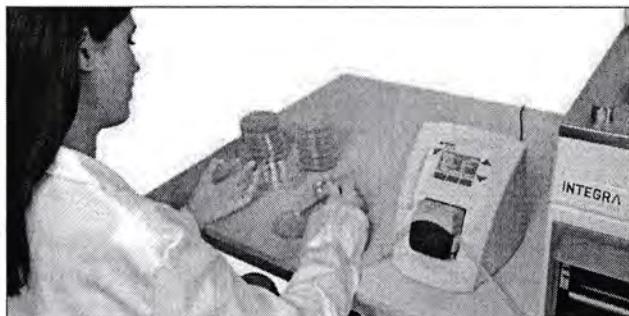

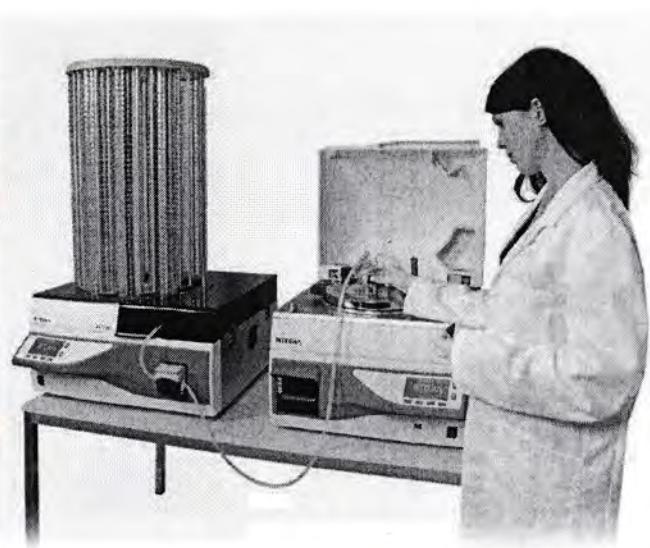

Dispensing of the sterilized media

Easy Dispensing

The wide adding port facilitates fast and safe addition of supplements such as antibiotics, blood or growth factors prior to dispensing. The automatic in-process sterilization of the dispense port eliminates the risk of medium contamination during dispensing.

The vessel and the dispensing system of the MEDIACLAVE were designed to avoid dead volume, allowing laboratories to save costs due to maximal medium yield.

The MEDIACLAVE can be quickly and conveniently connected to the dispensing tubing of the automated Petri dish filler MEDIAJET, allowing the dispensing of agar media into up to 540 Petri dishes at the touch of a button.

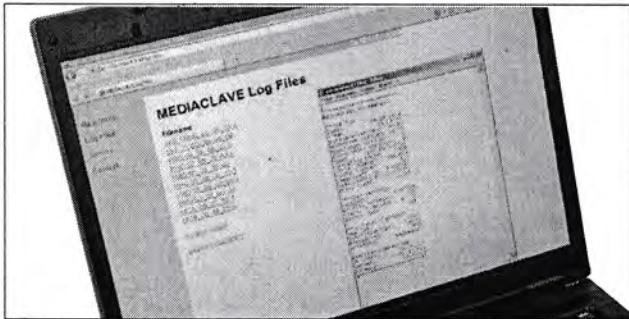

In addition, the peristaltic pump DOSE IT can be used to fill containers of more unusual volumes or shapes, e.g. quadrangular Petri dishes, bottles or flasks.

Alternatively, large containers such as bottles can be filled by pressure dispensing. The optionally available pressure dispensing kit, including a pinch valve box and a foot switch, allows the direct and fast dispensing of medium by automatically building up pressure inside the sterilization chamber.

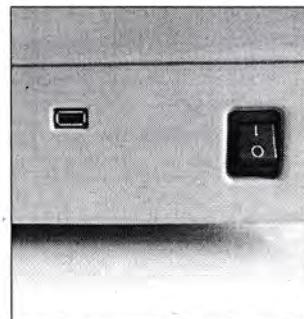

Documentation of the media preparation process

MEDIACLAVE provides all necessary tools to support individual needs in process documentation and validation. An integrated web server for direct connectivity via Ethernet allows remote monitoring of the sterilization process and instrument parameters. Moreover, it allows the durable electronic storage of process data, circumventing the need to archive printouts. A digital signature according to FDA (21 CFR Part 11) / EU (GMP Annex 11) can be automatically added to the electronic process file.

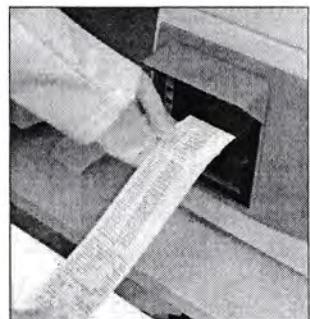

In addition, MEDIACLAVE enables the electronic storage of all process data to a USB flash drive. All process log files are saved automatically if a flash drive is connected to the MEDIACLAVE USB port. If equipped with the optionally available dot matrix printer, high quality printouts insusceptible to fading can be archived. Printout intervals and parameters are individually adjustable for all process phases and hence allow laboratories to reduce paper consumption and operation costs. Alternatively, a standard external printer can be connected directly via the serial interface.

Web server

USB port

Dot matrix printer

Cleaning and maintenance of MEDIACLAVE

MEDIACLAVE is designed to keep maintenance easy. The absence of any heating element within the sterilization vessel makes the cleaning of the vessel easy.

The integrated CLEANING procedure automatically sterilizes the vessel, valves and the tubing inside MEDIACLAVE. Hot, sterile coupling water is drained at the process end; dissolving and removing unwanted agar residues in the system effectively. This allows a complete decontamination of all vulnerable parts of the instrument and thus ensures the best possible environment for sterile media preparation.

An automatic indication of the next service to be due prevents unnecessary downtime, thus maximising the productivity of the whole media kitchen.

MEDIAJET Versatile and reliable media processing

MEDIAJET – versatile dispensing system

For laboratories involved in culture media preparation, sterile dispensing is essential for successful downstream applications and to meet quality requirements. Furthermore, as a growing need for cost saving and performance improvements exists, a reliable work flow is necessary.

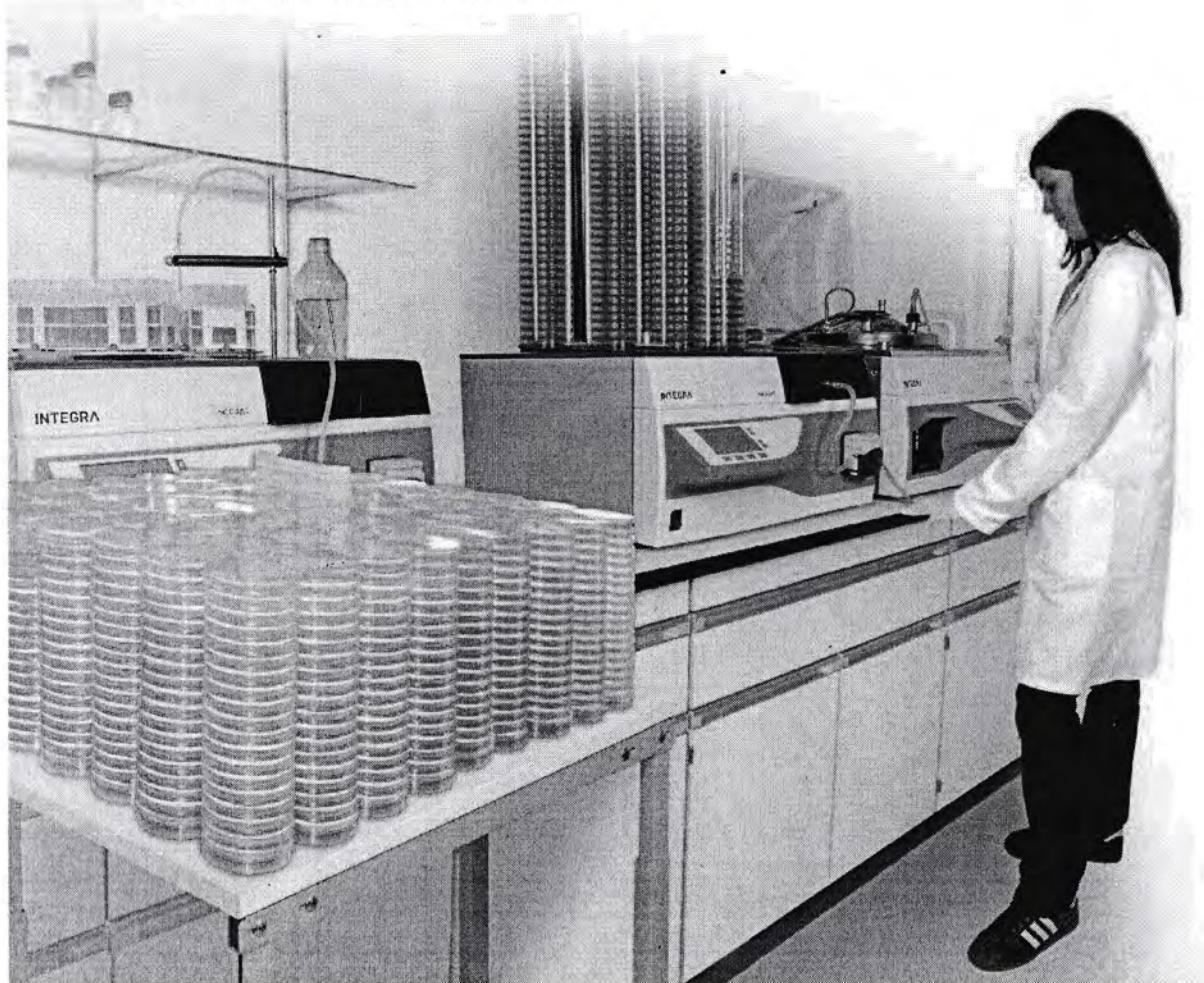

These requirements have created a strong demand for an automated medium dispensing system that allows reliable walk-away operation and at the same time fulfills quality requirements. MEDIAJET has been developed to meet these needs.

The MEDIAJET system offers the unique flexibility to fill Petri dishes of various sizes, Petri dishes with two compartments as well as test tubes of various diameters and length. At the same time, MEDIAJET requires only minimal bench space in the laboratory.

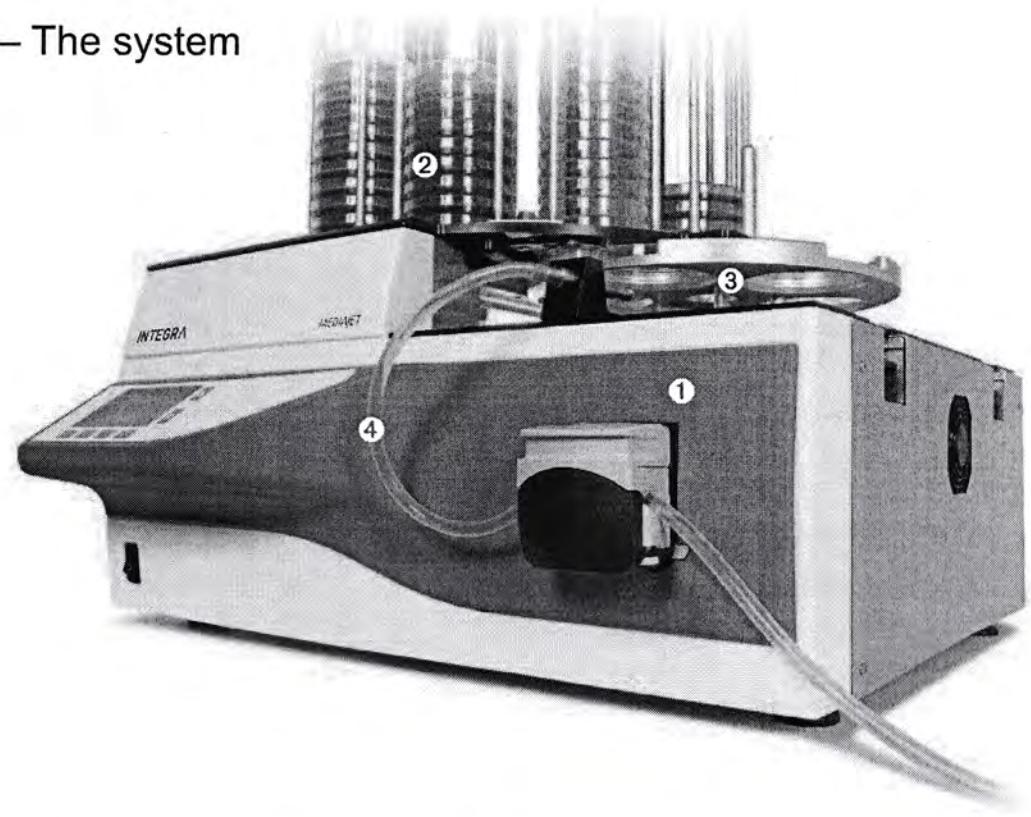

MEDIAJET is the perfect complementation to the INTEGRA MEDIACLAVE media preparator range as it allows the continuous filling of up to thirty litres media into Petri dishes.

Additional options:

- Petri dish cooling
- Petri dish imprinting
- Printing of MEDIAJET process parameters

Petri dish filling – The system

- ① Base unit
- ② Carousel
- ③ Rotor
- ④ Tubing set

Easy handling

The intuitive, full size graphical user interface makes it very easy to control all functions of MEDIAJET. The operation of the system is entirely self-explanatory, as all functions and prompts are explained in plaintext.

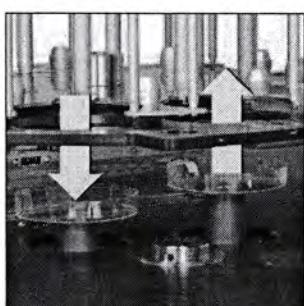

Media cost reduction

MEDIAJET has a built-in "Agar Spread Function" which ensures a homogenous distribution and an even surface of the agar. It helps to optimise the agar level in the Petri dish and thereby allows a significant reduction of media costs.

Reliable walk-away automation

With the novel Feed-In / Stack-Out technology, MEDIAJET guarantees a reliable and completely user independent operation. Typical production variations in the diameter or shape of the Petri dishes are easily handled by the unit, as they are actively guided throughout the entire filling process. Moreover, the optical dish sensors of MEDIAJET can be easily adjusted to virtually every Petri dish brand at the user interface level.

Eliminating sources of contamination

For consistent agar plate quality, a clean environment during the dispensing process is essential. The surface of the filling chamber is manufactured of a single piece of resistant PE, which allows convenient and efficient cleaning. In addition, MEDIAJET is equipped with a UV lamp extending over the full length of the rotor where the dishes are opened during the dispensing process. The lamp emits powerful 2.1 W UV-C radiation for optimal bactericidal efficiency in the area most vulnerable to contamination.

Operation

MEDIAJET is easily set up and quickly ready for use. Load the carrousel with up to 540 Petri dishes, connect the MEDIAJET to your sterilised culture medium source and start the automated dispensing at the touch of a button.

Up to 19 individual Petri dish filling programs with user-defined parameter settings such as dish height, dispensing volume or number of dishes can be saved and recalled.

Different operation modes for Petri dish filling can be executed and the parameters set to your needs:

1. STANDARD mode:

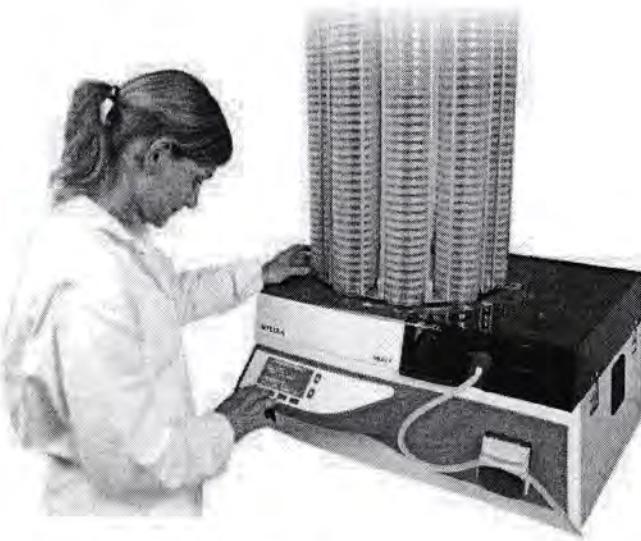

Is used for the standard filling of Ø 90, 60 or 35 mm Petri dishes.

2. TURBO mode:

Is used to accelerate the filling process. Together with the optional turbo mode kit installed, up to 1'100 Petri dishes can be filled in one hour.

3. POUR PLATE mode:

Total viable count determination is mainly carried out by using the pour plate method. However, pouring the plates by hand is time-consuming and laborious. The POUR PLATE mode facilitates this process by automatically shaking the Petri dishes. Depending on the volume or viscosity of the

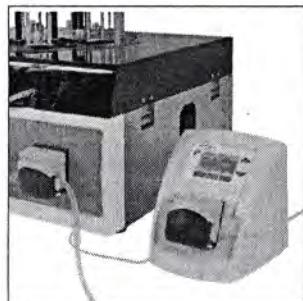

medium to be filled into Petri dishes, different shaking levels are selectable according to requirements.

4. BATCH mode:

The Batch mode can be used for applications where it is important to have a highly planar agar surface, as for example automatic colony counting.

Special Applications

Blood agar preparation:

MEDIAJET allows the control of the INTEGRA peristaltic pump DOSE IT. This accessory is especially useful to continuously mix additives in the concentration of 3-10% into the medium. Blood, for instance, can be added into the agar immediately before pouring the plates, which minimises the risk of thermal denaturation of the additive.

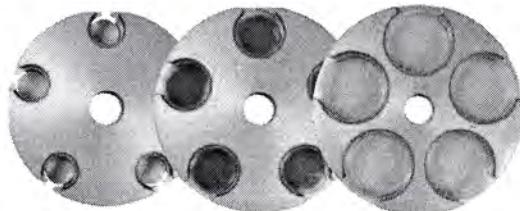

Independent pump functions:

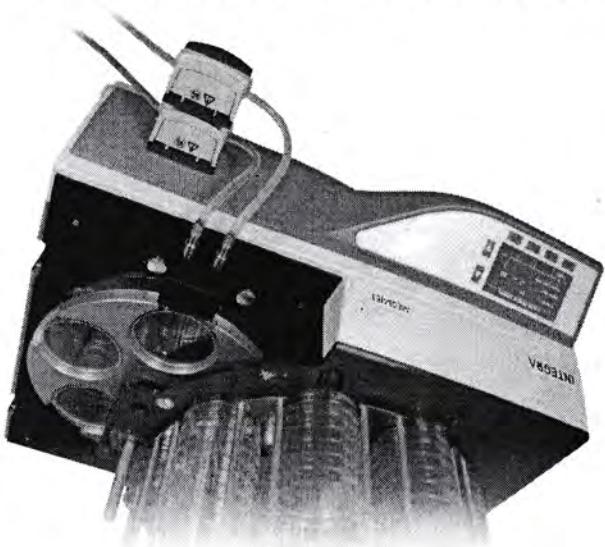

The MEDIAJET pump can be independently used for other applications like the manual filling of tubes or bottles. Dispensing can be conveniently triggered by the optionally available foot switch. This feature is especially useful when using Petri dishes or tubes of unusual sizes or shapes that can not be processed by the automated MEDIAJET filling system.

Processing Ø 35, 60 or 90 mm Petri dishes

MEDIAJET vario not only allows the filling of Ø 90 mm dishes, but also Ø 60 or 35 mm dishes by using the corresponding conversion set. In just a few minutes, the MEDIAJET vario base unit can be converted and adjusted to fill the Petri dishes of choice, providing invaluable flexibility to your media preparation lab.

For every lab involved in culture media production, the UBE-FILLER option is the perfect extension to the functionality of MEDIALLET. It allows you to convert the automated Petit dish pourer into a test tube filler in just a minute. This unique solution from INTEGRA Biosciences makes MEDIALLET the most versatile system for media dispensing in the market.

Filling dishes with two compartments

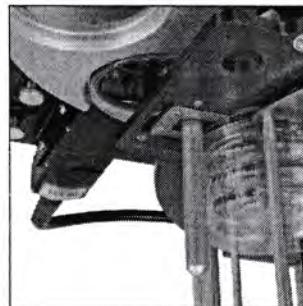

For many applications, the amount of required agar can be reduced by using two-compartment Petri dishes. However, pour-ing biplates by hand is time-consuming and inefficient. With the MEDIALET variable biplate option you have an efficient and reliable solution to fill two-compartment Petri dishes automatically.

Process documentation and validation

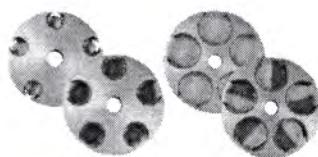

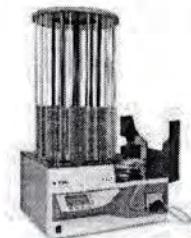

Test tube filter option for MEDIALJET

All supported inkjet printers allow side wall imprinting. Alternatively, dislches can be imprinted on the bottom using the LINX 4900 inkjet printer module.

Different options are available
