

Data sheet

Differential pressure controller (PN 16)

AVP - return and flow mounting, adjustable setting

AVP-F - return mounting, fixed setting

Description

AVP(-F) is a self-acting differential pressure controller primarily for use in district heating systems. The controller closes on rising differential pressure.

The controller has a control valve, an actuator with one control diaphragm and handle for differential pressure setting (fixed setting version is without handle).

Main data:

- DN 15-32
- k_{vs} 0.4 - 10 m³/h
- PN 16
- Setting range (AVP):
0.05 - 0.5 bar / 0.2 - 1.0 bar / 0.8 - 1.6 bar
- Fixed setting (AVP-F): 0.2 bar / 0.3 bar / 0.5 bar
- Temperature:
 - Circulation water / glycolic water up to 30%:
2 ... 150 °C
- Connections:
 - Ext. thread (weld-on, thread and flange tailpieces)

Ordering

Note: other controllers available on request.

Example:

Differential pressure controller; return mounting; DN 15; k_{vs} 1.6; PN 16; setting range 0.2 - 1.0 bar; t_{max} 150 °C; ext. thread;

- 1x AVP DN 15 controller
Code No: **003H6206**

Option:

- 1x Impulse tube set AV, R 1/8
Code No: **003H6852**

- 1x Weld-on tailpieces
Code No: **003H6908**

The controller will be delivered completely assembled, inclusive impulse tube between valve and actuator. External impulse tube (AV) must be ordered separately.

Application principles

- Return mounting

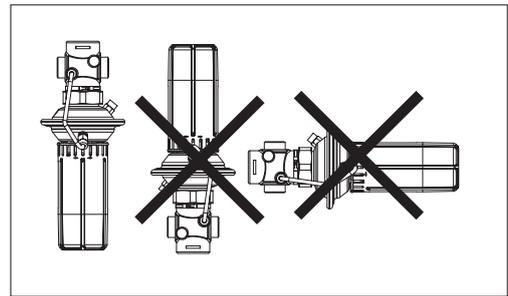

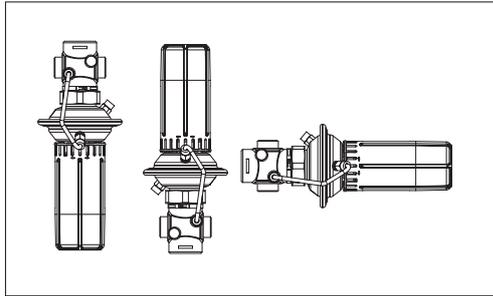

- Flow mounting

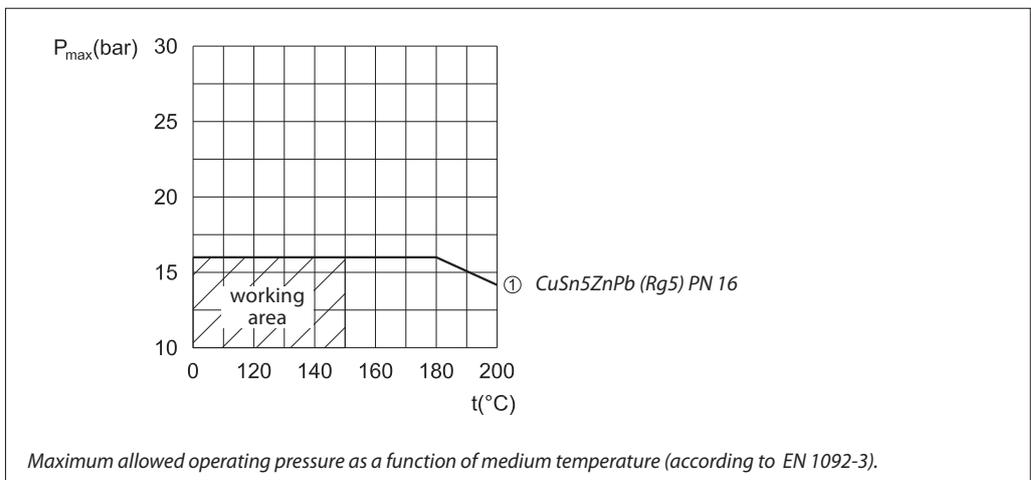

Installation positions

Up to medium temperature of 100 °C the controllers can be installed in any position.

For higher temperatures the controllers have to be installed in horizontal pipes only, with a pressure actuator oriented downwards.

Pressure temperature diagram

Sizing

- Directly connected heating system

Example 1

Motorised control valve (MCV) for mixing circuit in direct-connected heating system requires differential pressure of 0.2 bar (20 kPa).

Given data:

- Q_{max} = 1.3 m³/h (1300 l/h)
- Δp_{min} = 0.7 bar (70 kPa)
- * $\Delta p_{circuit}$ = 0.1 bar (10 kPa)
- Δp_{MCV} = 0.2 bar (20 kPa) selected

*Remark

$\Delta p_{circuit}$ corresponds to the required pump pressure in the heating circuit and is not to be considered when sizing the AVP

The differential pressure set value is:

$$\Delta p_{set\ value} = \Delta p_{MCV}$$

$$\Delta p_{set\ value} = 0.2\ bar\ (20\ kPa)$$

The total pressure loss across the controller is:

$$\Delta p_{AVP} = \Delta p_{min} - \Delta p_{MCV} = 0.7 - 0.2$$

$$\Delta p_{AVP} = 0.5\ bar\ (50\ kPa)$$

Possible pipe pressure losses in tubes, shut-off fittings, heatmeters, etc. are not included.

k_v value is calculated according to formula:

$$k_v = \frac{Q_{max}}{\sqrt{\Delta p_{AVP}}} = \frac{1.3}{\sqrt{0.5}}$$

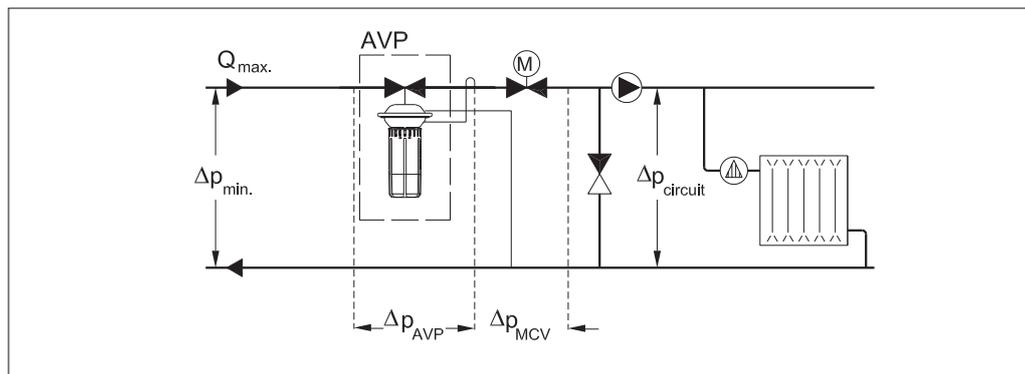

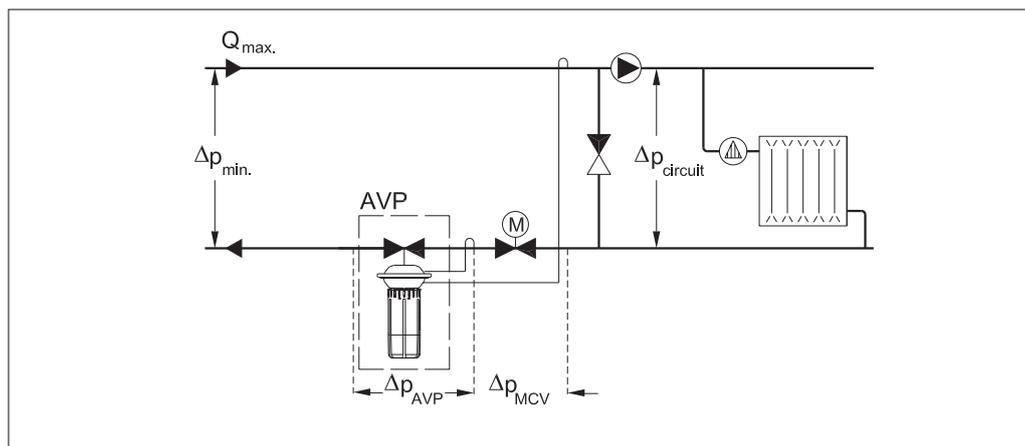

$$k_v = 1.8\ m^3/h$$

or read from the sizing diagram, page 7, by taking a line from Q-scale (1.3 m³/h) through Δp_v -scale (0.5 bar) to intersect k_v -scale at 1.8 m³/h.

Solution:

The example selects AVP DN 15, k_{vs} value 2.5, with differential pressure setting range 0.05 - 0.5 bar.

The P-band (Xp) can also be read from the sizing diagram. Take a horizontal line from the k_v -scale (1.8 m³/h) to the right to intersect the X_p -scale (0.04 bar). At a set value of 0.2 bar and a X_p of 0.04 bar the AVP controller controls between 0.2 bar with open motorised control valve and 0.2 + 0.04 = 0.24 bar at almost closed motorised control valve (i.e. total pressure loss across the motorised control valve).

Sizing (continuous)

- Indirectly connected heating system

Example 2

Motorised control valve (MCV) for indirectly connected heating system requires differential pressure of 0.3 (30 kPa) bar.

Given data:

- Q_{max} = 0.8 m³/h (800 l/h)
- Δp_{min} = 0.8 bar (80 kPa)
- $\Delta p_{exchanger}$ = 0.05 bar (5 kPa)
- Δp_{MCV} = 0.3 bar (30 kPa) selected

The differential pressure set value is:

$$\Delta p_{set\ value} = \Delta p_{exchanger} + \Delta p_{MCV} = 0.05 + 0.3$$

$$\Delta p_{set\ value} = 0.35\ \text{bar (35 kPa)}$$

The total pressure loss across the controller is:

$$\begin{aligned} \Delta p_{AVP} &= \Delta p_{min} - \Delta p_{exchanger} - \Delta p_{MCV} \\ &= 0.8 - 0.05 - 0.3 \end{aligned}$$

$$\Delta p_{AVP} = 0.45\ \text{bar (45 kPa)}$$

Possible pipe pressure losses in tubes, shut-off fittings, heatmeters, etc. are not included.

k_v value is calculated according to formula:

$$k_v = \frac{Q_{max}}{\sqrt{\Delta p_{AVP}}} = \frac{0.8}{\sqrt{0.45}}$$

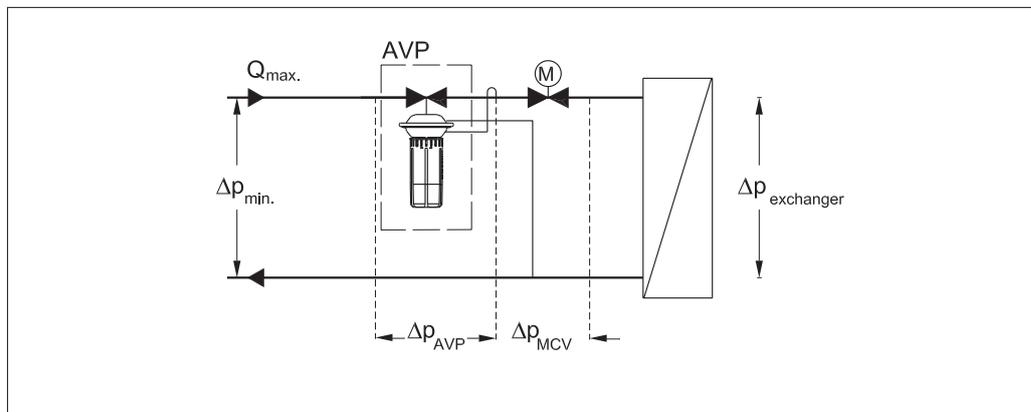

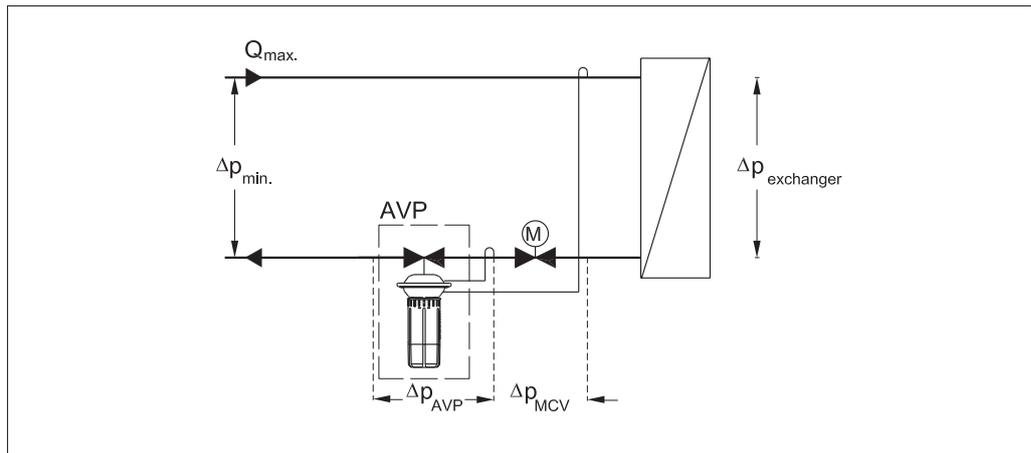

$$k_v = 1.2\ \text{m}^3/\text{h}$$

or read from the sizing diagram, page 7, by taking a line from Q-scale (0.8 m³/h) through Δp_v -scale (0.45 bar) to intersect k_v -scale at 1.2 m³/h.

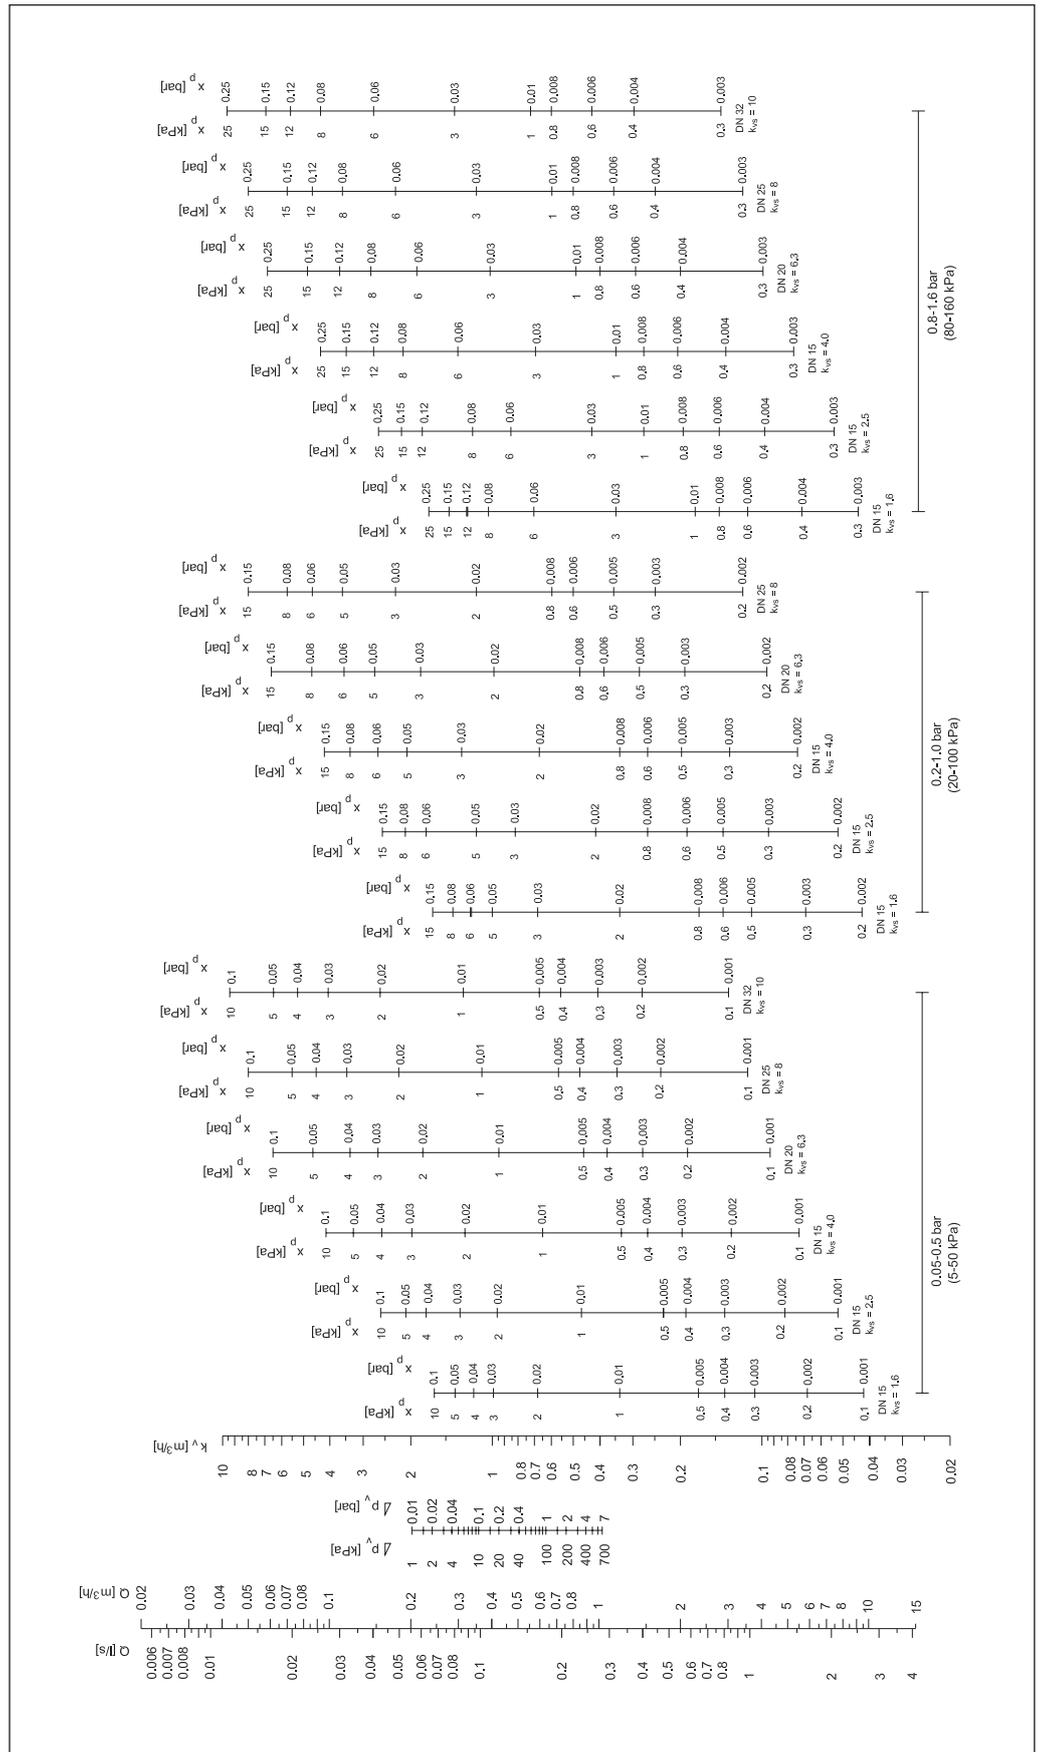

Solution:

The example selects AVP DN 15, k_{vs} value 1.6, with differential pressure setting range 0.05 - 0.5 bar.

The P-band (X_p) can also be read from the sizing diagram. Take a horizontal line from the k_v -scale (1.2 m³/h) to the right to intersect the X_p -scale (0.04 bar). At a set value of 0.35 bar and a X_p of 0.04 bar the AVP controller controls between 0.35 bar with open motorised control valve and $0.35 + 0.04 = 0.39$ bar at almost closed motorised control valve (i.e. total pressure loss across the motorised control valve).

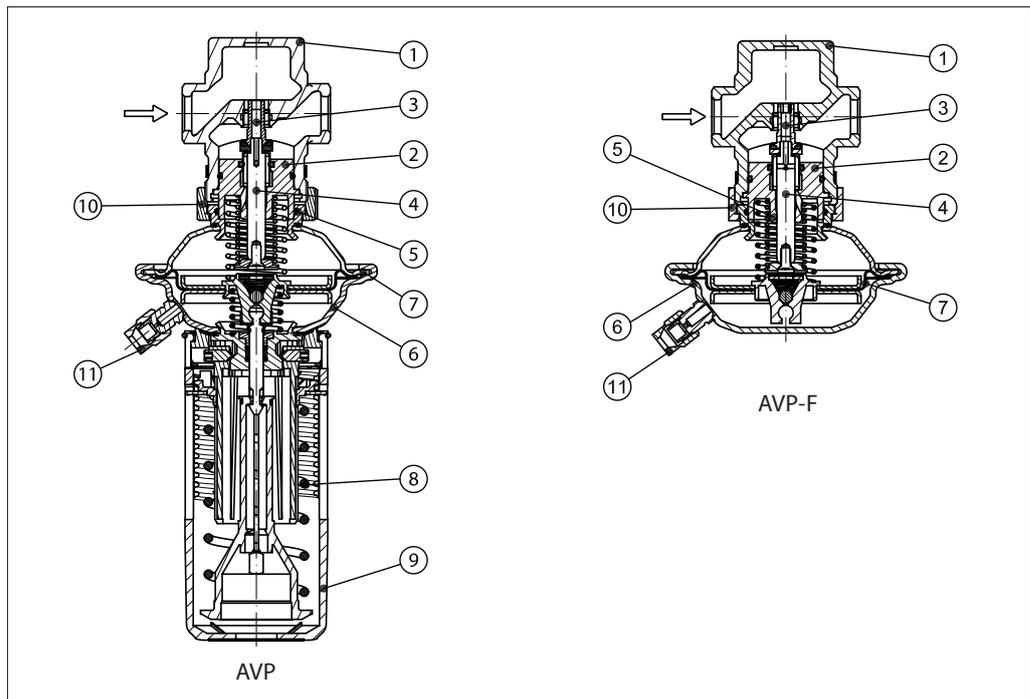

Sizing (continuous)

Select suitable controller size. Xp should not exceed 50% of the controller differential pressure setting.

Design

- 1. Valve body
- 2. Valve insert
- 3. Pressure relieved valve cone
- 4. Valve stem
- 5. Control drain
- 6. Actuator
- 7. Control diaphragm
- 8. Setting spring for diff. pressure control
- 9. Handle for diff. pressure setting, prepared for sealing
- 10. Union nut
- 11. Compression fitting for impulse tube

Function

Pressure changes from the flow and return pipeline are being transferred through the impulse tubes and/or control drain in the actuator stem to the actuator chambers and act on control diaphragm. Control valve closes on rising differential pressure and opens on falling differential pressure to maintain constant differential pressure.

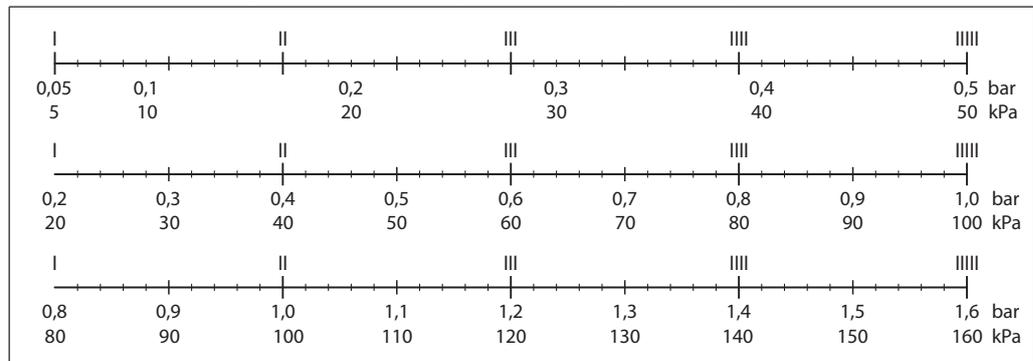

Controller is equipped with excess pressure safety valve, which protects actuator from too high differential pressure.

Settings

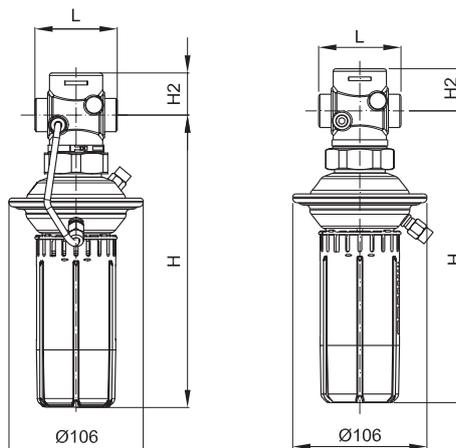

Differential pressure setting
 Differential pressure setting is being done by the adjustment of the setting spring for diff. pressure control. The adjustment can be performed on the basis of diff. pressure adjustment diagram (see relevant instructions) and/or pressure indicators.

Adjustment

Relation between scale figures and differential pressure. Values given are approximate.
