IN VITRO DIAGNOSTIC USE

CLINICAL SIGNIFICANCE (1) (6) (7)

The Prothrombin time (PT) is a useful basic coagulation screening test to investigate the extrinsic coagulation pathway.
PT (in sec.) converted into PT (%) allows the evalution of the prothrombinic activity, referring to a normal plasma (100 %).
A deficient prothrombinic activity has been observed in the following clinical states :

- Hemorrhagic disease of the newborn.
- Liver failure (cirrhosis, hepatitis...).
- Vitamine K deficiency or treatment with vitamin K antagonists.
- Congenital deficits in one of the factors associated with the prothrombinic complex, real prothrombin (factor II), proaccelerin (factor V), proconvertin (factor VII) and Stuart's factor (factor X)
- Circulating anticoagulants
- Fibrinolysis
- DIC (disseminated intravascular coagulation).

Monitoring of treatment with vitamin K antagonists :
The PT (in sec.) may be converted into INR (International Normalised Ratio). In that case, the origin of the thromboplastin has no incidence on the determination of the expected values. An international standardisation about INR reference intervals has been established for the treatment and prophylaxis of veinal and arterial thromboembolisms.
Avoid results in INR in the case of pre-operative chek-up or investigations for liver diseases.

PRINCIPLE (4)

Quick and al. method. Principle as follows :
The clotting time is measured at 37°C in the presence of tissular thromboplastin and calcium. The PT (in sec.) so measured is then converted into PT (%) or INR.

REAGENTS

Vial R1 **THROMBOPLASTIN**

Freeze-dryed Thromboplastin (Rabbit cerebral tissue)

Vial R2 **RECONSTITUTION BUFFER**

SAFETY CAUTIONS

BIOLABO reagents are designated for professional, in vitro diagnostic use.

- Use adequate protections (overall, gloves, glasses).
- Do not pipette by mouth.
- Avoid contact with skin and eyes.
- If spilt, thoroughly wash affected areas with plenty of water.
- Reagents contain sodium azide (concentration < 0,1%) which may react with copper and lead plumbing. Flush with plenty of water when disposing.
- For further information, Material Safety Data Sheet is available upon request.
- Waste disposal : Respect legislation in force in the country.

All specimens or reagents from biological origin should be handled as potentially infectious, in accordance with good laboratory practices using appropriate precautions. Respect legislation in force in the country.

REAGENTS PREPARATION

- **Thromboplastin** (Vial R1)
  Use a non-sharp instrument to remove aluminium cap from the vial.
- **Reconstitution buffer** (Vial R2)
  Once opened add promptly to the contents of the vial R1 the amount of dilution buffer (vial R2) stated on the label.
  Mix gently until complete dissolution before using reagent (approximatively 30 min.).
- **OWREN KÖLLER Buffer** REF 13883 (Ready for use).
  To establish the Thivolle line (results in %)

STABILITY AND STORAGE

Store at 2-8°C.

Prior to reconstitution :

- Stable until expiry date stated on the label.

Once opened :

- Vial R1 : (once reconstituted) : at least for 8 hours at room temperature and 5 days at 2-8°C.
- Vial R2 : at least for 6 months when free from contamination.
- REF 13883 : free from contamination at least for 3 months (reject any cloudy reagent).

Discard any reagent which control values are out of the range.

SPECIMEN COLLECTION AND HANDLING (2) (8)

Careful venipuncture.

- Blood/anticoagulant ratio : 4.5 mL of blood for 0.5 mL of sodium citrate 2 H_2O 0.109 M. Avoid blood drawing with a syringe that could result in the formation of micro-clots. Centrifugate for 5 minutes at 2500 g.
- Run the assay within 4 hours after collection, storing plasma at room temperature (15-25°C).
- Collection on citrate Hepes tube increases the specimen stability up to 8 hours.

INTERFERENCES (2) (3)

The presence of an heparin inhibitor in the reagent allows to perform this test without influence of this factor.
Due to activation of factor VII by cold, long storage of plasma at 2-8°C may shorten the result of PT (in sec.).
Contamination by Thromboplastin or hemolysed specimens may also shorten the result of PT (in sec.).
Apply the above mentionned Blood/anticoagulant ratio.
Adjust the volume of anticoagulant in case of very abnormal hematocrit.
For a more comprehensive review of factors affecting this assay, refer to the publication of Young D.S.

CALIBRATION

Reference plasma

Prepare a pool of at least 6 freshly drawn normal plasmas as for patient specimen. This pool of plasmas will be used as reference plasma (100 %).
Alternatively use a reference plasma with a 100 %. PT.

Use Calculation board

or

Plot a Thivolle line (PT %) as follows:

Dilute the pool of plasmas or the reference plasma, at 25 % in Owren Köller Buffer REF 13883 as follows :

	100 %	25 %
Plasma	1 mL	0.25 mL
Owren-Köller Buffer	–	0.75 mL

Do not use diluent such as saline solution that modifies the concentration of anticoagulant.

5 mL plastic tubes are suggested for dilution (according to the above board).

Plot on a regular graph, on the X-axis the mean of a triplicate clotting time (in seconds) and on the Y-axis (1/d) each reciprocal dilution for the point 100 % (1/d = 1) and 25 % (1/d = 4). Draw the Thivolle line.

QUALITY CONTROL

REF 13961	Normal Control Plasma	6 x 1 mL
REF 13962	Pathological High Control Plasma	6 x 1 mL
REF 13963	Pathological Low Control Plasma	6 x 1 mL

- Or other assayed control plasmas referring to the same method.
- External quality control program.

It is recommended to control in the following cases :

- At least once a run.
- At least once within 24 hours.
- When changing vial of reagent.
- After maintenance operation on the instrument.

If control is out of range, apply following actions :

1. Repeat the test with the same control plasma.
2. If control is still out of range, prepare a fresh control plasma and repeat the test.
3. If control is still out of range, calibrate with a new vial of reagent.
4. If control is still out of range, use a new vial of reference plasma and repeat the test.
5. If control is still out of range, please contact BIOLABO technical support or your local Agent.

PERFORMANCE CHARACTERISTICS

Within run N = 20	Normal level	Patho-H level	Patho-L level	Between run N = 20	Normal level	Patho-H level	Patho-L level
Mean (sec)	12.3	25.1	30.3	Mean (sec)	12.2	21.6	30.6

- ✓Newborn : prolonged by 2-3 sec.
- ✓Premature : prolonged by 3-5 sec.

PT (in sec.) reaches adult level by day 3 or 4.

Normal PT (%) :

- ✓Ranging beetwen 70 to 100 %.
- ✓Values over 100 % have no significance.

Oral anticoagulant therapy (OAT) :

Indications	Therapeutical range in INR		PT (%)
	Target	Acceptable range	Rabbit thromboplastin
Pre-operative and during surgery : *Hip surgery	2.5	2.0 – 3.0	35 %
*Other surgery	2.0	1.5 – 2.5	40 %
Venous thrombosis prophilaxis	2.5	2.0 – 3.0	35 %
Evolutive phlebitis, pulmonar embolism, recurrent phlebitis	3.0	2.0 – 4.0	27 %
Arterial prophylaxis, mechanical prosthetic valves	3.5	3.0 – 4.5	25 %

PROCEDURE

Manual procedure

PT (sec.) measurement in test tubes at 37°C. Mix gently the reagent before pipetting.

Plasma	0.1 mL
Incubate for 2 minutes at 37°C	
37°C prewarmed (at least 15 minutes) thromboplastin :	0.2 mL
Simultaneously start a timer and record the clotting time.	

Assay each plasma in duplicate (triplicate for calibration curve).
Adding thromboplastin, gently tilt back and forth near to horizontal position, until a solid gel clot appears. Operate under sufficient lighting.

Automated Instrument procedure

The sedimentation characteristics and the optical quality of this thromboplastin are suitable for mechanical or optical detection systems. Refer to the instrument manufacturer's instructions.

CALCULATION (6)

With enclosed calculation board :
Refer to the enclosed calculation board (including ISI value) corresponding to the current batch number to calculate PT (%) and INR.
Section 1 : Select the column corresponding to the measured time for 100 % PT reference plasma.
Identify the patient's PT (sec) in this column.
Section 2 : On the same line, refer to the corresponding PT (%) or INR.

With Thivolle line « PT in % » (see § **CALIBRATION**) :
Plot the clotting time measured for the patient on the Thivolle line and then read on the Y-axis the reciprocal dilution corresponding. Reverse and multiply by 100 to obtain the PT (%) for patient.

Patients under OAT: INR values are recommended for a better determination of the therapeutical ranges.

INR calculation as follows :

$$INR = \left(\frac{\text{Patient's time}}{\text{Mean normal time}} \right)^{ISI}$$

SYPHILIS SEROLOGY KIT
DIRECTIONS FOR USE

RPR CARBON KIT: For Detection Of Syphilis.

SUMMARY

At one time, syphilis was a major medical disease with a host of different manifestations transmitted primarily through sexual contact. The advent of penicillin in 1943 changed this. The etiologic agent of syphilis is *Treponema pallidum*, a spiral bacterium (spirochete). The spirochete causes some damage to the heart and the liver, releasing some tissue fragments. The patient's immune system produces antibodies, called reagins, against these fragments. There are two different techniques for the detection of syphilis. TPHA tests, which detect antibodies to *Treponemal pallidum*, and non-treponemal serologic tests, which detect Reagin in infected people.

PRINCIPLE

When used by the recommended techniques, the reagent will agglutinate (clump) in the presence of reagin. No agglutination usually indicates the absence of reagin (see **Limitations**).

KIT DESCRIPTION

Lorne RPR Carbon Kit is a non-treponemal serologic test for the detection of syphilis. The RPR Carbon Antigen contains micro particulate carbon, which aids in the microscopic reading of results. All the reagents are supplied at optimum dilution for use with all recommended techniques without the need for further dilution or addition. For lot reference number and expiry date see **Vial Labels**.

STORAGE

Do not freeze. Reagent vials should be stored at 2 - 8°C on receipt. Prolonged storage at temperatures outside this range may result in accelerated loss of reagent reactivity.

SPECIMEN COLLECTION

Specimens should be drawn with or without anticoagulant using an aseptic phlebotomy technique. If testing is delayed specimens can be stored at 2-8°C for 7 days or for up to 3 months at or below –20°C. Specimens must be free from bacterial contamination, fibrin, haemolysis and lipaemia.

PRECAUTIONS

1. The kit is for *in vitro* diagnostic use only.
2. Do not use kit past expiration date (see **Vial and Box Labels**).
3. Protective clothing should be worn when handling the reagents, such as disposable gloves and a laboratory coat.
4. No known tests can guarantee products derived from human or animal sources are free from infectious agents. Care must be taken in the use and disposal of each vial and its contents.
5. RPR Positive Control: H319 - Causes serious eye irritation. Follow the precautionary statement given in the SDS.

DISPOSAL OF KIT REAGENT AND DEALING WITH SPILLAGES

For information on disposal of kit reagent and decontamination of a spillage site see **Material Safety Data Sheets**, available on request.

CONTROLS AND ADVICE

1. It is recommended the RPR Positive and Negative Controls be tested in parallel with each batch of tests. Tests must be considered invalid if controls do not show expected results.
2. Shake all the reagents well before use to ensure homogeneity.
3. Do not interchange components between different kits.
4. The circles on the agglutination cards should never be touched with fingers, as this may invalidate the test results.
5. Use of kit and interpretation of results must be carried out by properly trained and qualified personnel in accordance with the requirements of country where reagents are in use.
6. The user must the determine suitability of the kit for use in other techniques.

KIT COMPONENTS PROVIDED

1) RPR Carbon Antigen (Red Label): Carbon particles coated with a lipid complex (cardiolipin, lecithin and cholesterol) in phosphate buffer 20 mmol/L, pH 7.0 containing a preservative.
2) RPR Positive Control (Red cap): Artificial serum with reagin titer ≥ 1/4.
3) RPR Negative Control (Blue cap): Animal serum containing a preservative
4) Dispensing bottle (1 x 2 ml).
5) Dispensing Needle (x1).
6) Disposable agglutination slides.
7) Plastic stirrers.

MATERIALS AND EQUIPMENT NOT SUPPLIED

a) Pipette capable of accurately delivering 50 µl
b) Mechanical rotating table capable of rotating at 80-100 rpm.
c) 9 g/L saline solution.

QUALITATIVE TECHNIQUE

1. Allow the reagents and samples to reach room temperature. The sensitivity of the test may be reduced at low temperatures.
2. Place 50 µL of the sample and one drop of each Positive and Negative controls into separate circles on the slide test.
3. Swirl the RPR-carbon reagent gently before using. Invert the dropper assembly and press gently to remove air bubbles from the micropipette.
4. Place the micropipette in a vertical position and perpendicular to the slide, and add one drop (20 µL) of this reagent next to the samples to be tested.
5. Mix the drops with a stirrer, spreading them over the entire surface of the circle. Use different stirrers for each sample
6. Place the slide on a mechanical rotating table at 80-100 r.p.m. for 8 min. False positive results could appear if the test is read after more than 8 minutes.

INTERPRETATION OF QUALITATIVE RESULTS

1. **Reactive:** Visible agglutination (medium to large clumps) constitutes a positive result and within the accepted limitations of the test procedure, indicates the presence of reagin.
2. **Weak-Reactive:** Weak agglutination (small clumps) around the periphery of the test area constitutes a weak positive result and within the accepted limitations of the test procedure, indicates the presence of reagin.
3. **Negative:** No agglutination constitutes a negative result and within the accepted limitations of the test procedure, indicates the absence of reagin.

SEMI QUANTITATIVE TECHNIQUE

1. The semi-quantitative test can be performed in the same way as the quantitative technique using dilutions of the serum in 9 g/L saline solution.
2. Make doubling dilutions of specimen as follows:

Dilution	Serum	Saline
1/2	100 µl undiluted serum	100 µl
1/4	100 µl 1/2 diluted serum	100 µl
1/8	100 µl 1/4 diluted serum	100 µl
1/16	100 µl 1/8 diluted serum	100 µl

3. Test the specimen dilutions in the same way as for the quantitative technique above.
4. Read the test and note the last positive dilution series.

STABILITY OF THE REACTIONS

Slide tests should be interpreted straight after the 8-minute rotating period to avoid the possibility that a negative result may be incorrectly interpreted as positive due to drying of the reagent.

LIMITATIONS

1. RPR carbon test is non-specific for syphilis. All Reactive samples should be retested with treponemic methods such as TPHA and FTA-Abs to confirm the results.
2. A Non Reactive result by itself does not exclude a diagnosis of syphilis. Clinical diagnosis should not be made on findings of a single test result, but should integrate both clinical and laboratory data.
3. False positive results have been reported in diseases such as infectious mononucleosis, viral pneumonia, toxoplasmosis, pregnancy and autoimmune diseases.
4. Bilirubin (≤ 20 mg/dL), hemoglobin (≤ 10 g/L) and lipids (≤ 10 g/L), do not interfere. Rheumatoid factors (≥ 300 IU/mL), interfere. Other substances may interfere[5].
5. False positive or negative results may also occur due to:
   a) Not expelling air from end of needle
   b) Not maintaining dispensing bottle and needle in a vertical position when dispensing the antigen.
   c) When transferring the specimen from the collecting tube some of the specimen being drawn up in to the teat
   d) Contamination of test materials
   e) Improper storage of test materials or omission of reagents
   f) Deviation from the recommended techniques

SPECIFIC PERFORMANCE CHARACTERISTICS

1. The kit has been characterised by all the procedures mentioned in the **Recommended Techniques.**
2. Prior to release, each lot of Lorne RPR Syphilis Kit is tested by the **Recommended Techniques** to ensure suitable reactivity.
3. The reagent sensitivity is calibrated against the "Human Reactive Serum" from the CDC (Centres for Disease Control) and comparable to the RPR reagent from Becton Dickinson.
4. **Prozone effect:** No prozone effect was detected up to titers ≥1/128.
5. **Diagnostic sensitivity:** 100%
6. **Diagnostic specificity:** 100 %.

DISCLAIMER

1. The user is responsible for the performance of the kit by any method other than those mentioned in the **Recommended Techniques.**
2. Any deviations should be validated prior to use using established laboratory procedures.
