Device Description

Comprehensive Total Knee System –

The U2 Knee system is a comprehensive and organized total knee system for restoring the knee function throughout a full range of motion.

Based on the anatomy, kinematics, biomechanics, engineering and material technologies, the U2 Knee system offers fixed bearing, mobile bearing and revision prosthesis to satisfy different demands.

Since the launch of the U2 Knee System in 2005, over 170,000 cases have been implanted in 40 countries worldwide.

The U2 Knee has demonstrated excellent long-term clinical outcomes. The survival rate is 97.7% at 10 years follow up^[1].

United strives to create a more efficient and precise experience for utilization with orthopedic implants and instruments that are designed to relieve pain and improve knee function in patients.

INDICATIONS

The U2 Total Knee system is indicated in knee arthroplasty for reduction or relief of pain and/or improved knee function in skeletally mature patients with severe knee pain and disability due to rheumatoid arthritis, osteoarthritis, primary and secondary traumatic arthritis, polyarthritis, collagen disorders, avascular necrosis of the femoral condyle or pseudogout, posttraumatic loss of joint configuration, particularly when there is patellofemoral erosion, dysfunction or prior patellectomy, moderate valgus, varus, or flexion deformities. This device may also be indicated in the salvage of previously failed surgical attempts if the knee cannot be satisfactorily balanced and stabilized at the time of surgery.

The device includes Cruciate Retained (CR) type, Posterior Stabilized (PS) type and Ultracongruent (UC) type. CR and UC types are designed to collocate with CR femoral component, while PS type is designed to collocate with PS femoral component.

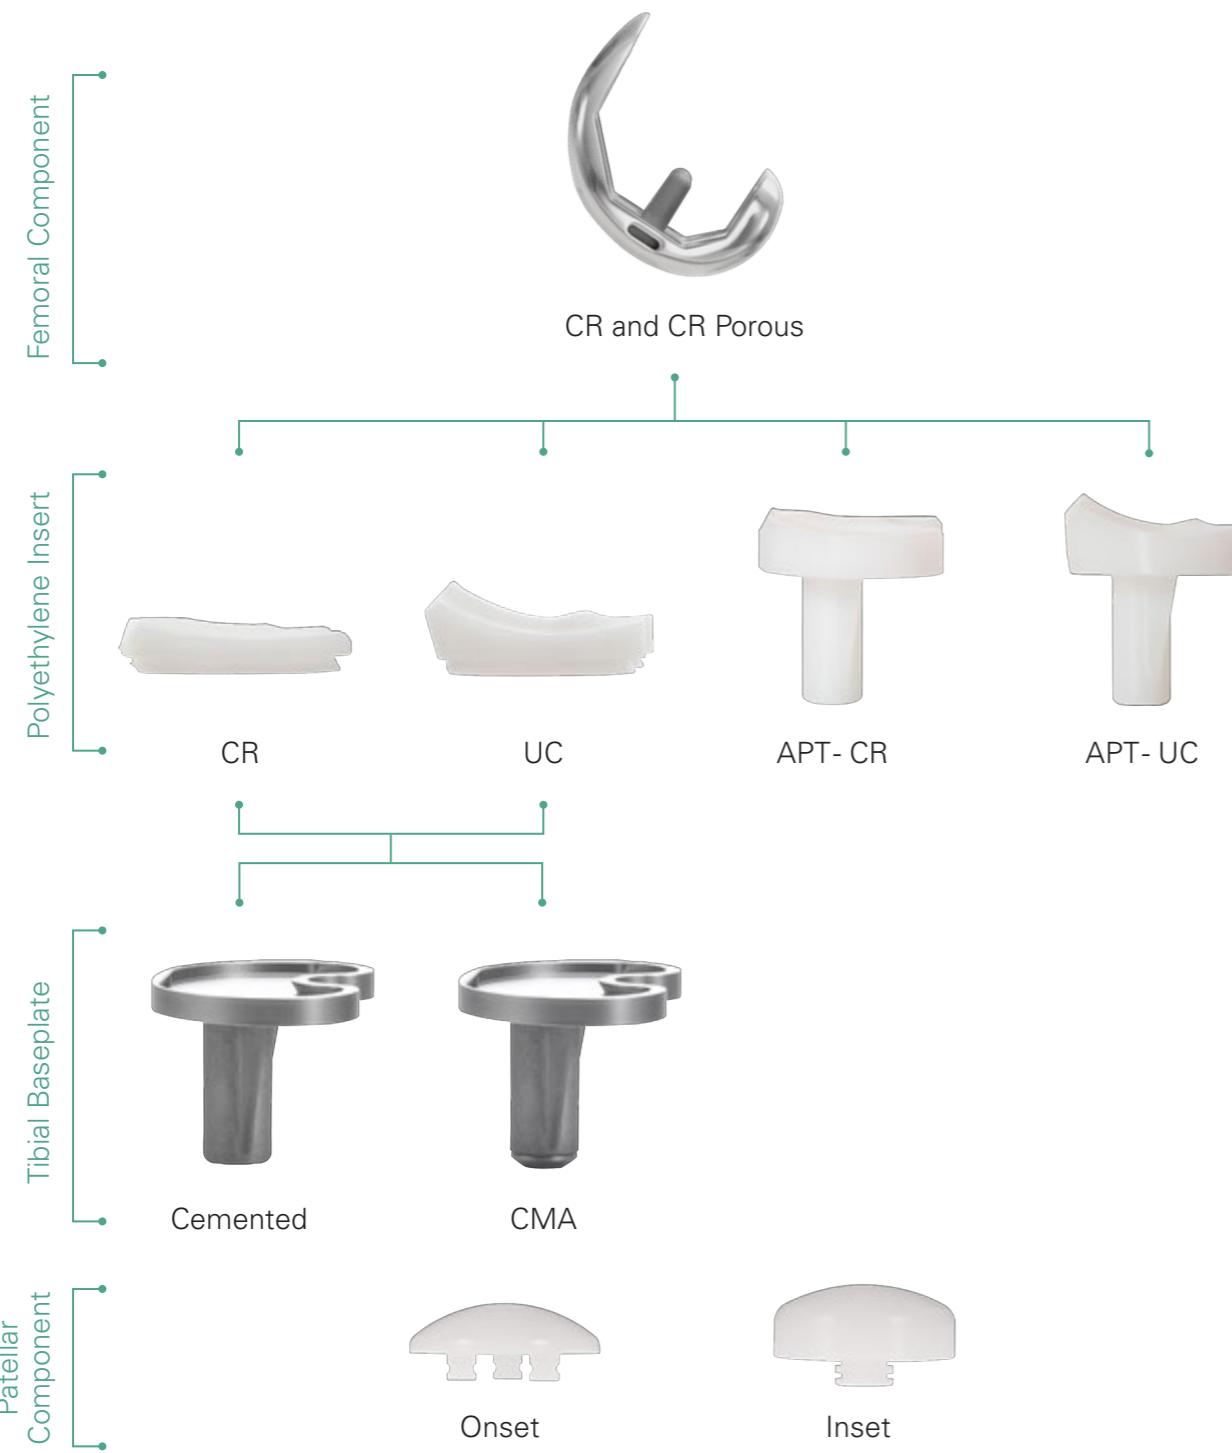

- For cemented type femoral components, patellar components, tibial baseplate components, tibial inserts components and all poly tibial component: This device is a single use implant and intended for cemented use only.
- For cementless type component and porous coated femoral component: This device is a single use implant and intended for cementless use only.

Please refer to the package inserts for important product information, including, but not limited to contraindications, warnings, precautions, and adverse effects.

Trial Instrument Compatibility

Modular Disposable Trials (MDT)

Femoral Trial Set (CR/PS) is comprised of 7 standard sizes plus 6 intermediate sizes, for a total of 13 femoral component selections. Each sterile package includes a CR notch trial & PS box trial to convert the femoral trial component from a CR to a PS design. A disposable PS Notch Cutting Guide is also included.

Tibial Trial Sets (CR/PS or UC) are comprised of 7 sizes of tibial baseplate trials and all thickness selections of inserts. Each sterile package includes the selected tibial baseplate trial, a standard 9 mm articulating surface trial, three 2 mm spacers, and one 3 mm spacer. An additional PS post trial that allows the CR insert trial to be converted to an PS insert trial.

Patellar Trial Set (onset or inset) includes all size selections of onset or inset patellar trials.

Reusable Trials

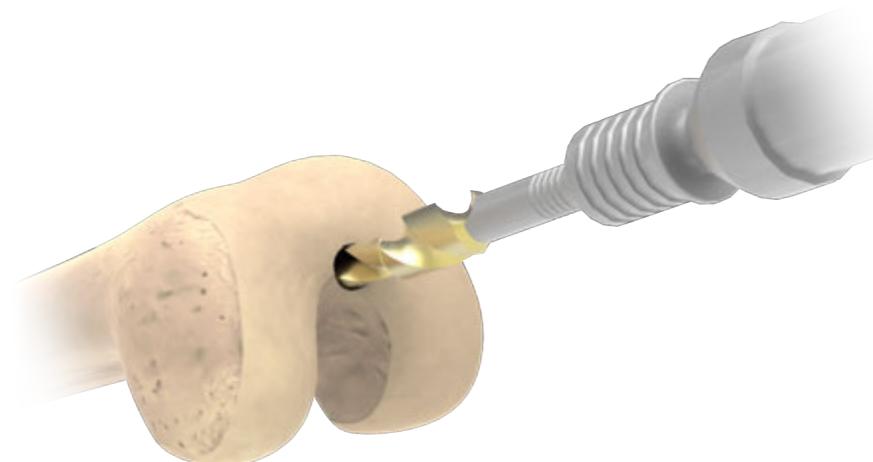

- 13 sizes of femoral component trials in both CR and PS designs
- 8 sizes of tibial baseplate trials
- 8 sizes x 5 thickness of insert trials in CR, PS and UC articulating designs
- 4 sizes of inset patellar trials
- 7 sizes of onset patellar trials

A. Distal Femoral Resection

Access Canal

With the ACL removed, the location of the typical femoral entry hole is deemed to be slightly medial to the center of the intercondylar notch, and approximately 5 to 7 mm anterior to the insertion of the PCL.

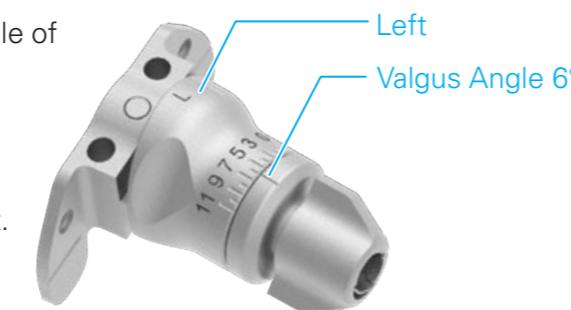

Use the **Step Drill** to create an opening into the femoral canal. This allows for depressurization of the canal when the **IM Rod** is inserted.

Set Femoral Valgus Angle

Use the **Femoral IM Alignment Guide** to set the angle of the distal femoral resection. Set the alignment guide for either a Left or Right Knee using the provided adjustment switch.

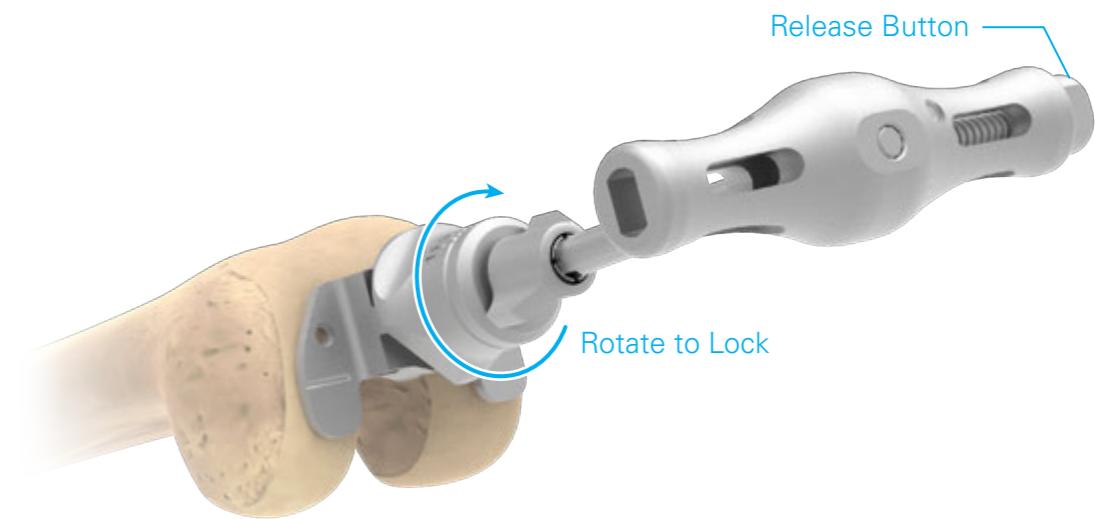

The guide allows up to 11° of valgus angle adjustment. The ideal angle should be determined according to pre-operative planning.

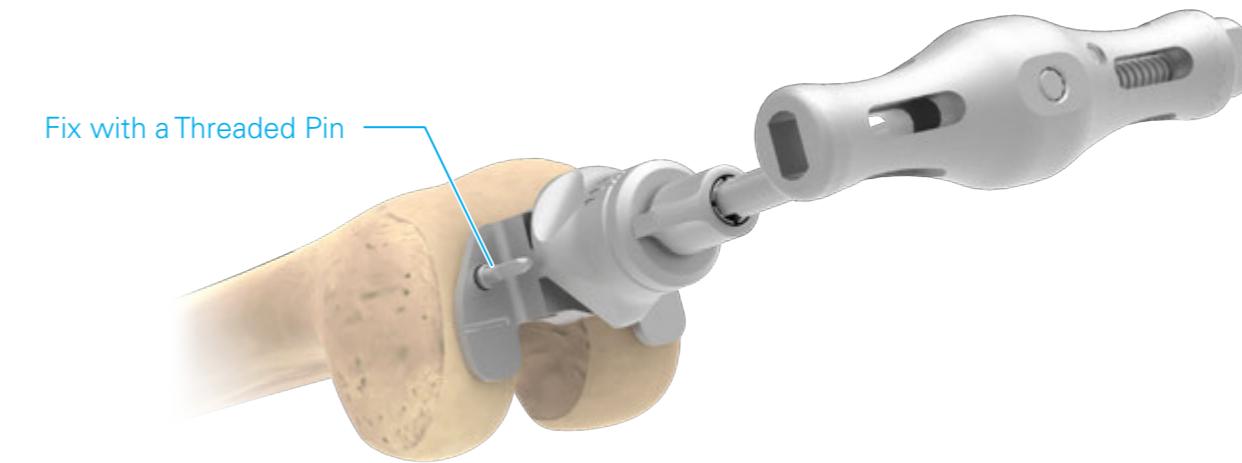

A. Distal Femoral Resection

Assemble the **IM Rod Handle**, **IM Rod**, and **Femoral IM Alignment Guide**, and manually insert past the isthmus of the femoral canal.

Rotate the locking knob at the end of alignment guide to secure the alignment guide to the **IM Rod**. If necessary, rotate the valgus angle dial for further adjustment.

When the alignment guide is properly engaged with the distal femur, use a **Threaded Pin** to secure the assembly.

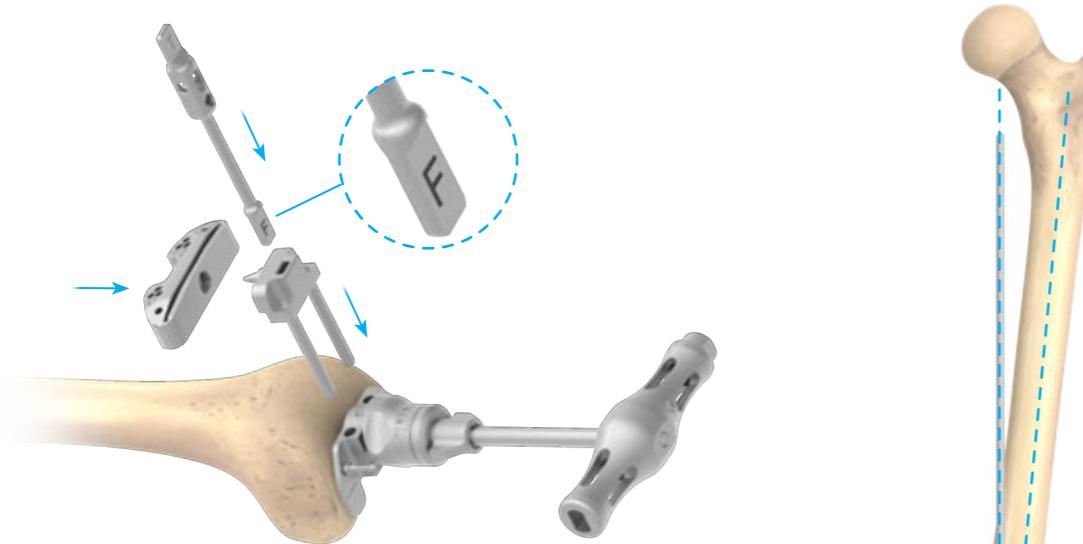

A. Distal Femoral Resection

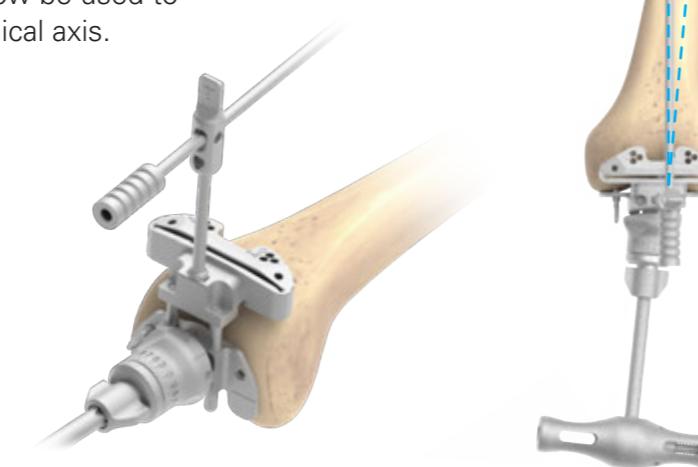

Distal Femoral Resection

Assemble the **Distal Femoral Alignment Guide** and the **Distal Femoral Resection Guide** to the **Femoral IM Alignment Guide**.

Insert the "F" end (Femur) of the **EM Alignment Tower** into the **Distal Femoral Alignment Guide** as shown.

The **Alignment Rod** can now be used to confirm the proper mechanical axis.

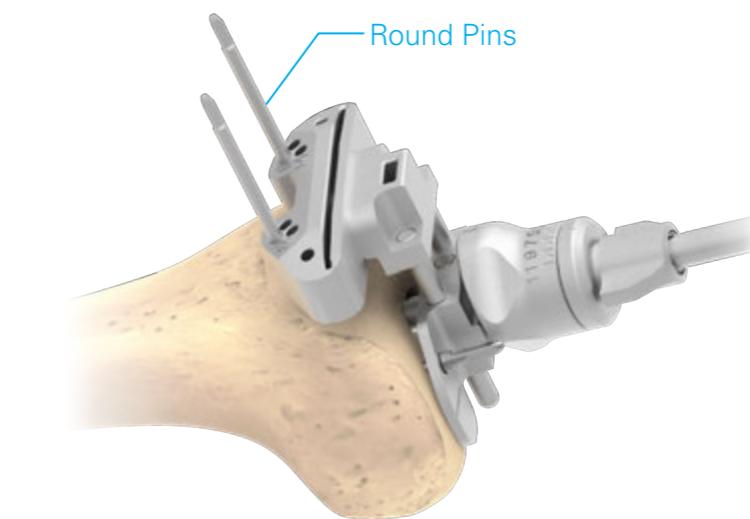

Instruments

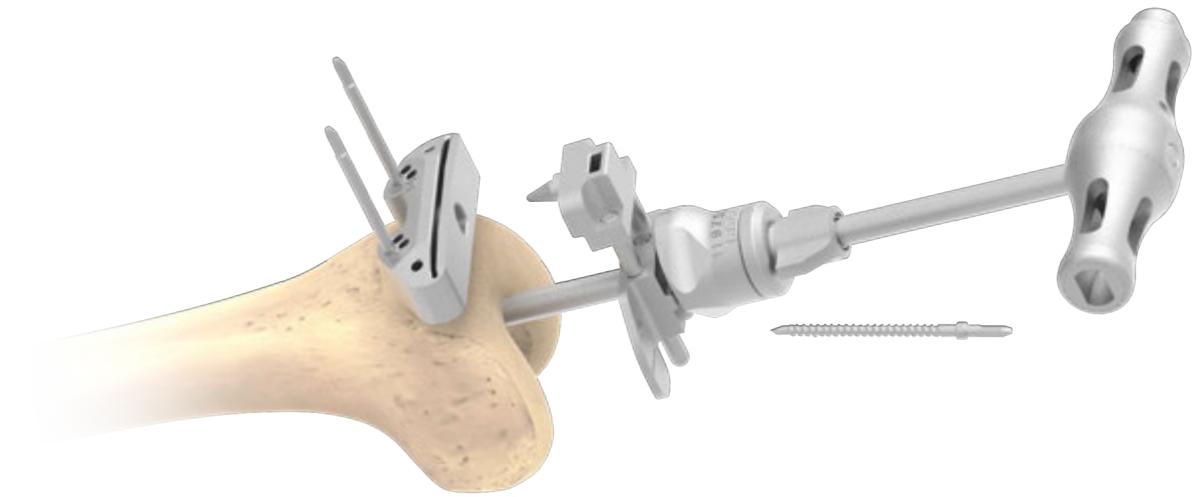

A. Distal Femoral Resection

Drill pilot holes through the "0" pin holes on the anterior surface of the **Distal Femoral Resection Guide**, and insert a pair of **Round Pins** to secure the resection guide.

Remove the **Threaded Pin** on the **Femoral IM Alignment Guide**. Disengage the **Distal Femoral Resection Guide** by pulling the **IM Rod Handle** distally.

Instruments

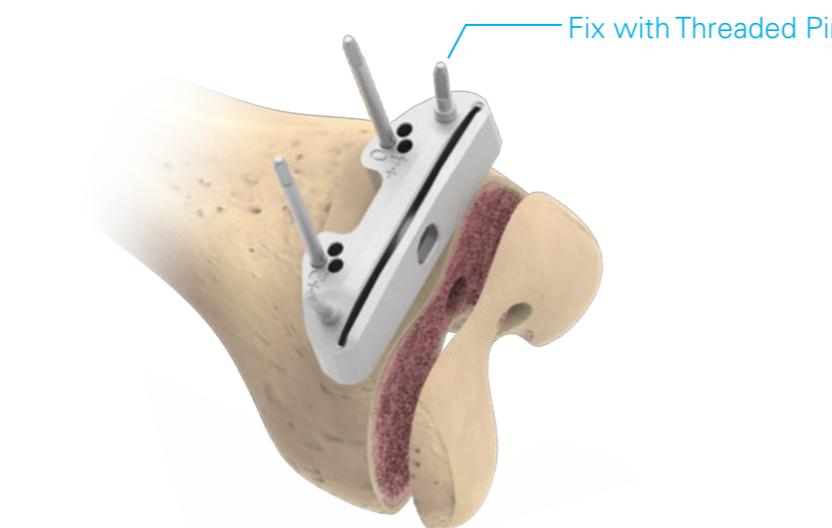

A. Distal Femoral Resection

+2 mm/+4 mm guide holes are provided to allow for repositioning of the **Distal Femoral Resection Guide**.

Before performing the distal femur resection, additional **Threaded Pins** may be placed to further secure the resection guide. Then, use a standard .050" (1.27 mm) saw blade through the cutting slot to resect the distal femur.

Instruments

Distal Femoral
Resection Guide

30 mm/50 mm

B. Proximal Tibial Resection

Tibial Extramedullary Alignment Method

Attach the selected **Tibial Resection Guide** to the **Tibial EM Alignment Guide**.

Instruments

Tibial Resection
Guide

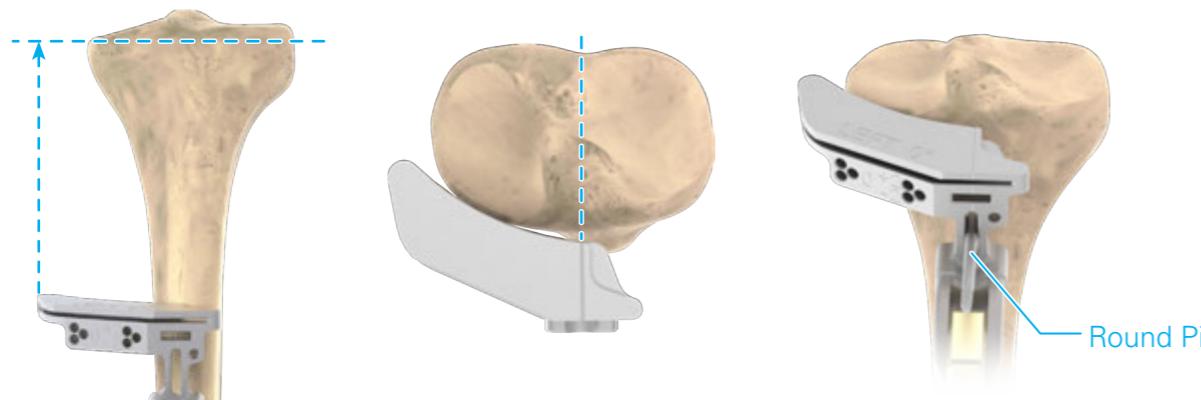

Tibial EM
Alignment Guide

B. Proximal Tibial Resection

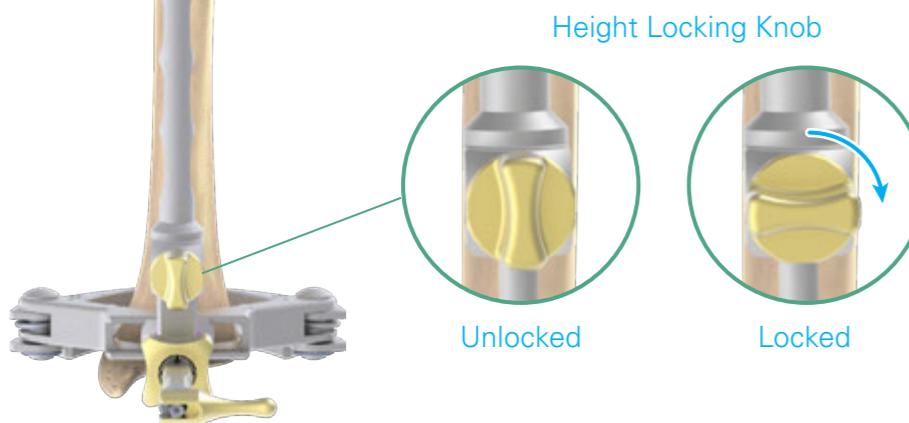

Place the knee in 90° flexion. Secure the clamps on the distal portion of the **Tibial EM Alignment Guide** around the ankle joint, proximal to the malleoli.

Rotate the height locking knob to the unlock position, and adjust the **Tibial EM Alignment Guide** to the approximate length of the tibia.

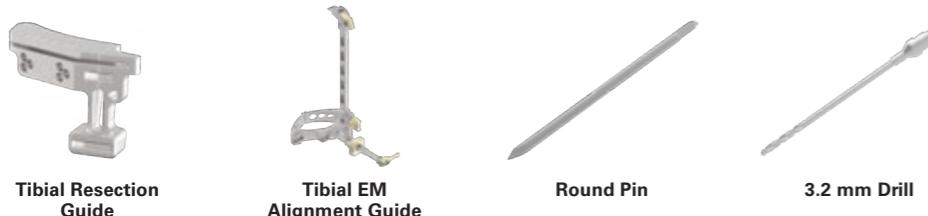

Align the central groove on the **Tibial Resection Guide** with the medial one third of the tibial tubercle.

Drill a pilot hole with the **3.2 mm Drill** through the vertical slot, and secure the proximal rotation with a **Round Pin**.

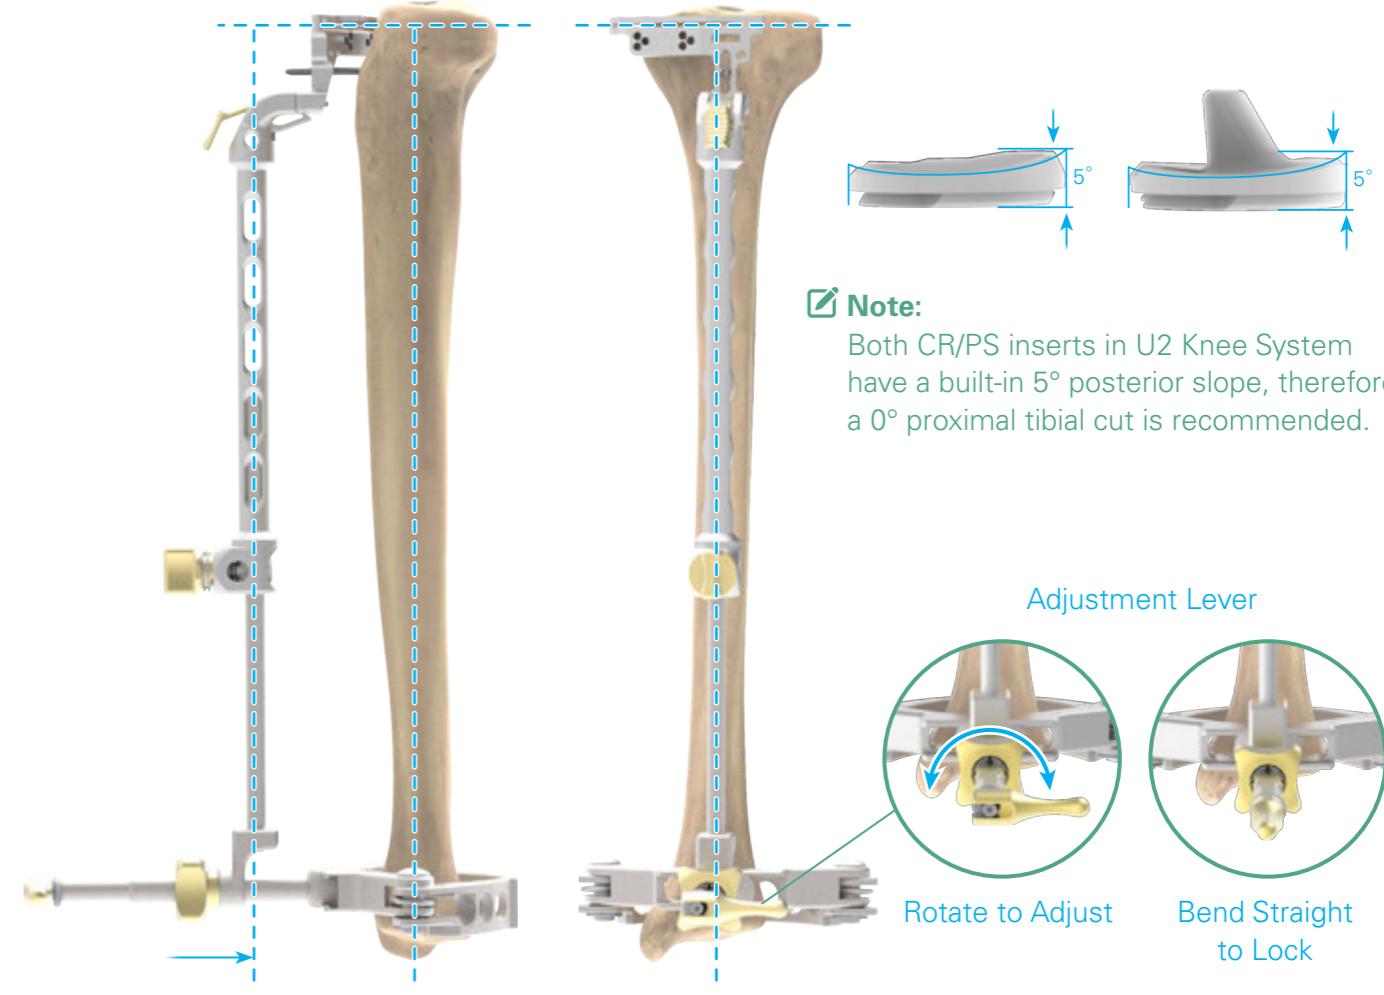

Instruments

B. Proximal Tibial Resection

Slide the A/P Locking Knob and adjust the **Tibial EM Alignment Guide** by moving it towards or away from the tibia until it is parallel to the tibial axis from a sagittal view.

Rotate the adjustment lever clockwise or counterclockwise adjusting the varus/valgus orientation until it is parallel to the tibial axis from a coronal view. Then rotate the knob of the adjustment lever to the lock position (straight) to secure the **Tibial EM Alignment Guide** in the correct position.

Note:
Both CR/PS inserts in U2 Knee System have a built-in 5° posterior slope, therefore, a 0° proximal tibial cut is recommended.

Instruments

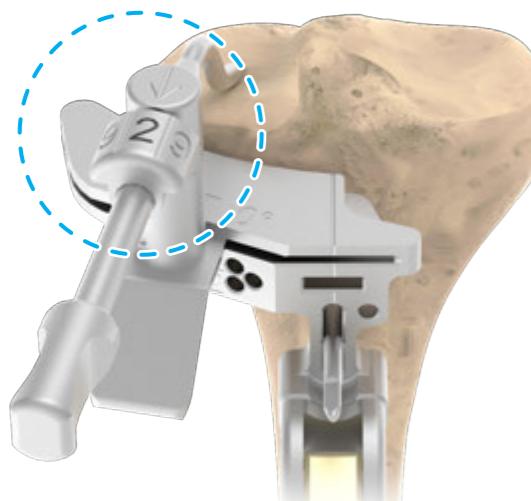

B. Proximal Tibial Resection

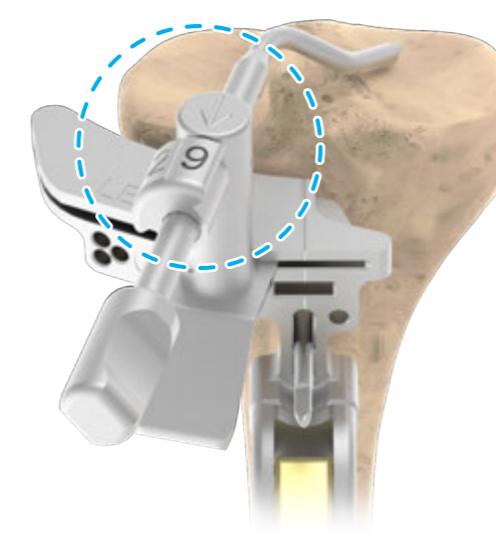

To determine the desired tibial resection level, insert the **Tibial Stylus** into the cutting slot and position the tip of the stylus onto the appropriate location on the tibial plateau.

The handle of the **Tibial Stylus** may be **rotated** in order to determine whether a 2 mm or 9 mm resection below the stylus tip is appropriate.

Once the desired resection level has been determined, prior to removing the stylus, rotate the height locking knob to secure the desired height.

The 2 mm stylus tip is used for minimal resection from the most affected tibial condyle

The 9 mm stylus tip is used for a 9 mm tibial bone cut from the least affected condyle.

Instruments		
Tibial Stylus	Tibial Resection Guide	Tibial EM Alignment Guide

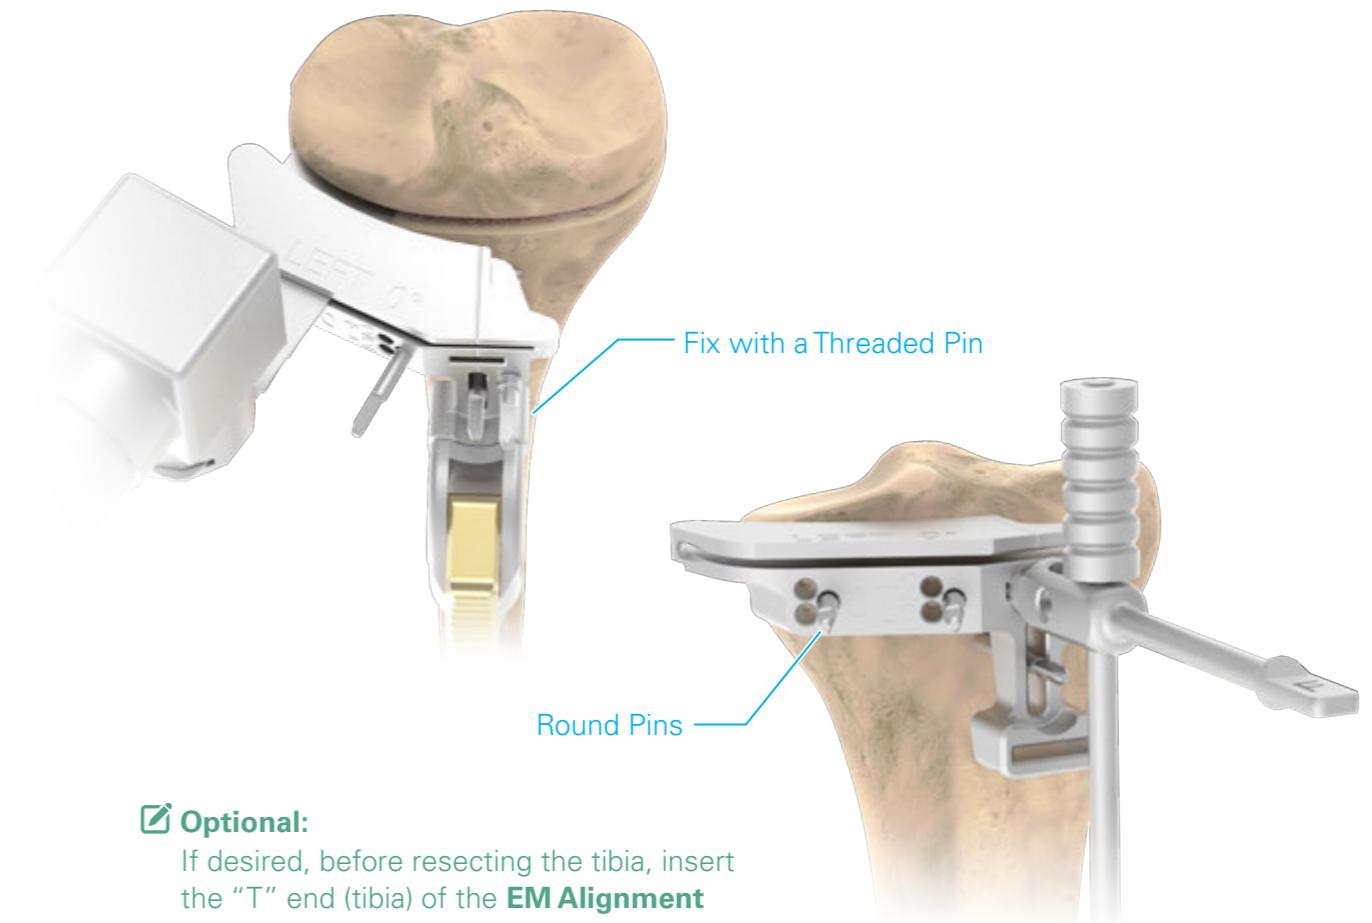

B. Proximal Tibial Resection

Remove the stylus.

Drill pilot holes with the **3.2 mm Drill** into the pin holes marked "0" on the anterior surface of the resection guide, and place two **Round Pins** to secure the **Tibial Resection Guide**.

Additional **Threaded Pins** may be placed through the angled hole for better fixation.

The proximal tibia may then be resected with or without the **Tibial EM Alignment Guide** in place.

Optional:

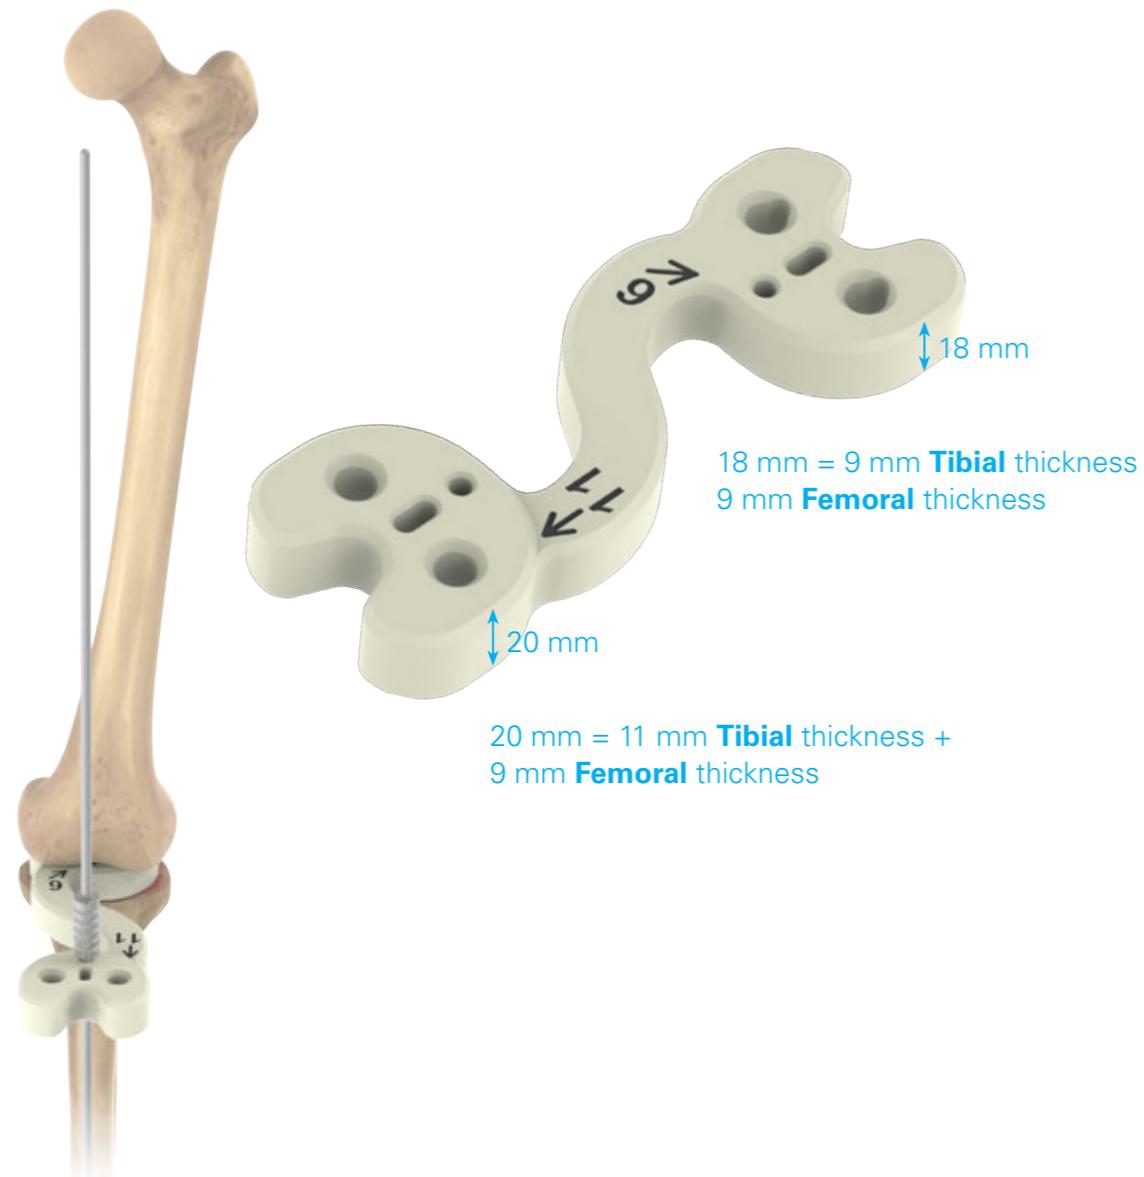

If desired, before resecting the tibia, insert the "T" end (tibia) of the **EM Alignment Tower** into the resection guide and use the **Alignment Rod** to re-check the alignment.

Instruments					

C. Extension Gap Assessment

Remove any osteophytes, meniscus or other soft tissue as needed to properly complete assessment.

Extend the knee and insert the appropriate end of the **Gap Gauge** to verify the extension gap of the knee. The **Alignment Rod** may be utilized to evaluate bone resection.

Instruments

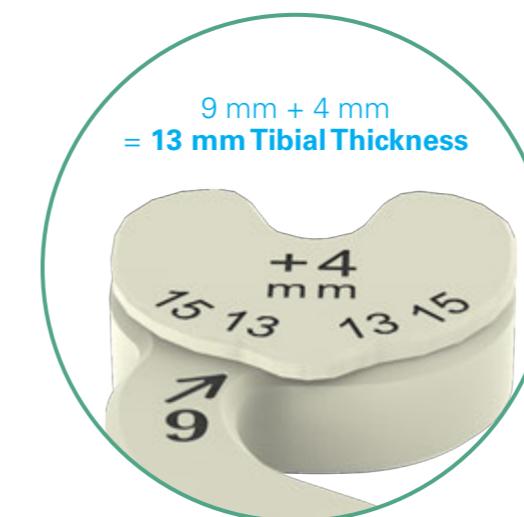

Gap Gauge
9/11 mm

Alignment Rod

C. Extension Gap Assessment

Additional +4 mm or +9 mm blocks may be combined with the **Gap Gauge** to evaluate the extension gap utilizing appropriate tension.

$9 \text{ mm} + 4 \text{ mm}$
 $= 13 \text{ mm Tibial Thickness}$

$11 \text{ mm} + 4 \text{ mm}$
 $= 15 \text{ mm Tibial Thickness}$

$9 \text{ mm} + 9 \text{ mm}$
 $= 18 \text{ mm Tibial Thickness}$

The same **Gap Gauge** can also be used to evaluate the flexion gap after femoral A/P resection.

Instruments

Gap Gauge
13/15 mm

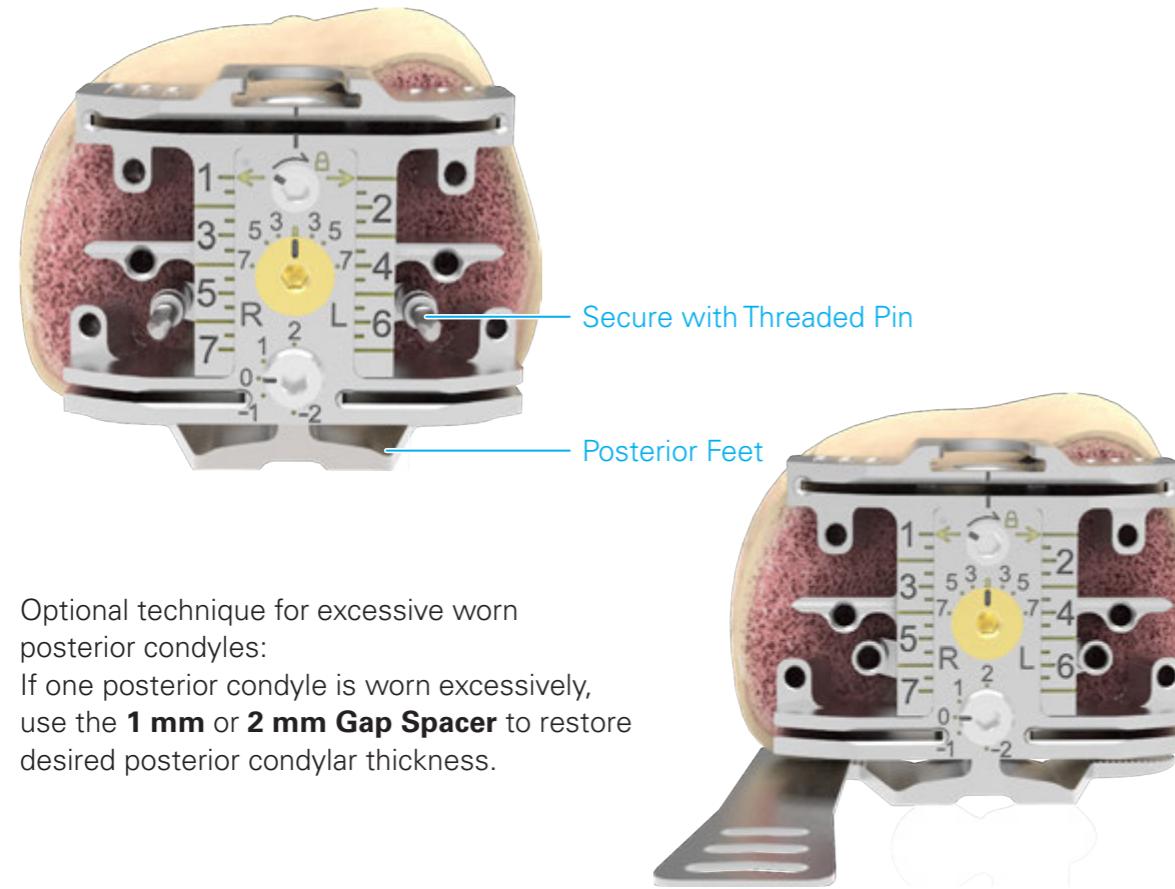

Gap Gauge
18 mm

D.Femoral Sizing and Chamfer Resection

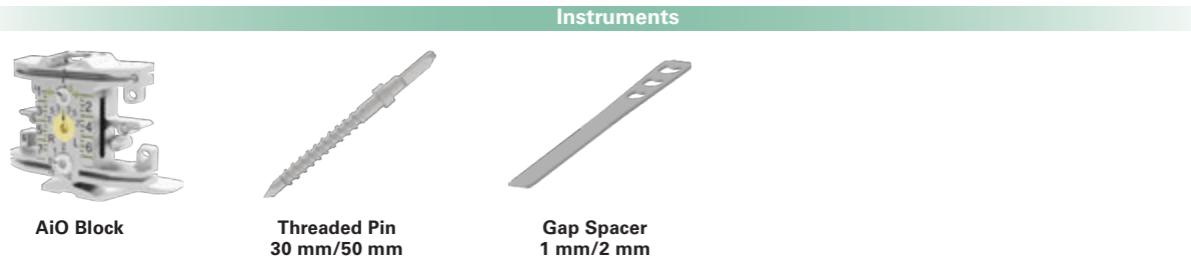

Placement of the AiO Block

Confirm the Bottom Knob of the **AiO Block** is set to the zero position. Place the AiO Block against the resected distal surface of the femur with the Posterior Feet of the block seated on the posterior condyles. Then secure the **AiO Block** with two 30 mm **Threaded Pins** through the Initial Fixation Holes.

Optional technique for excessive worn posterior condyles:

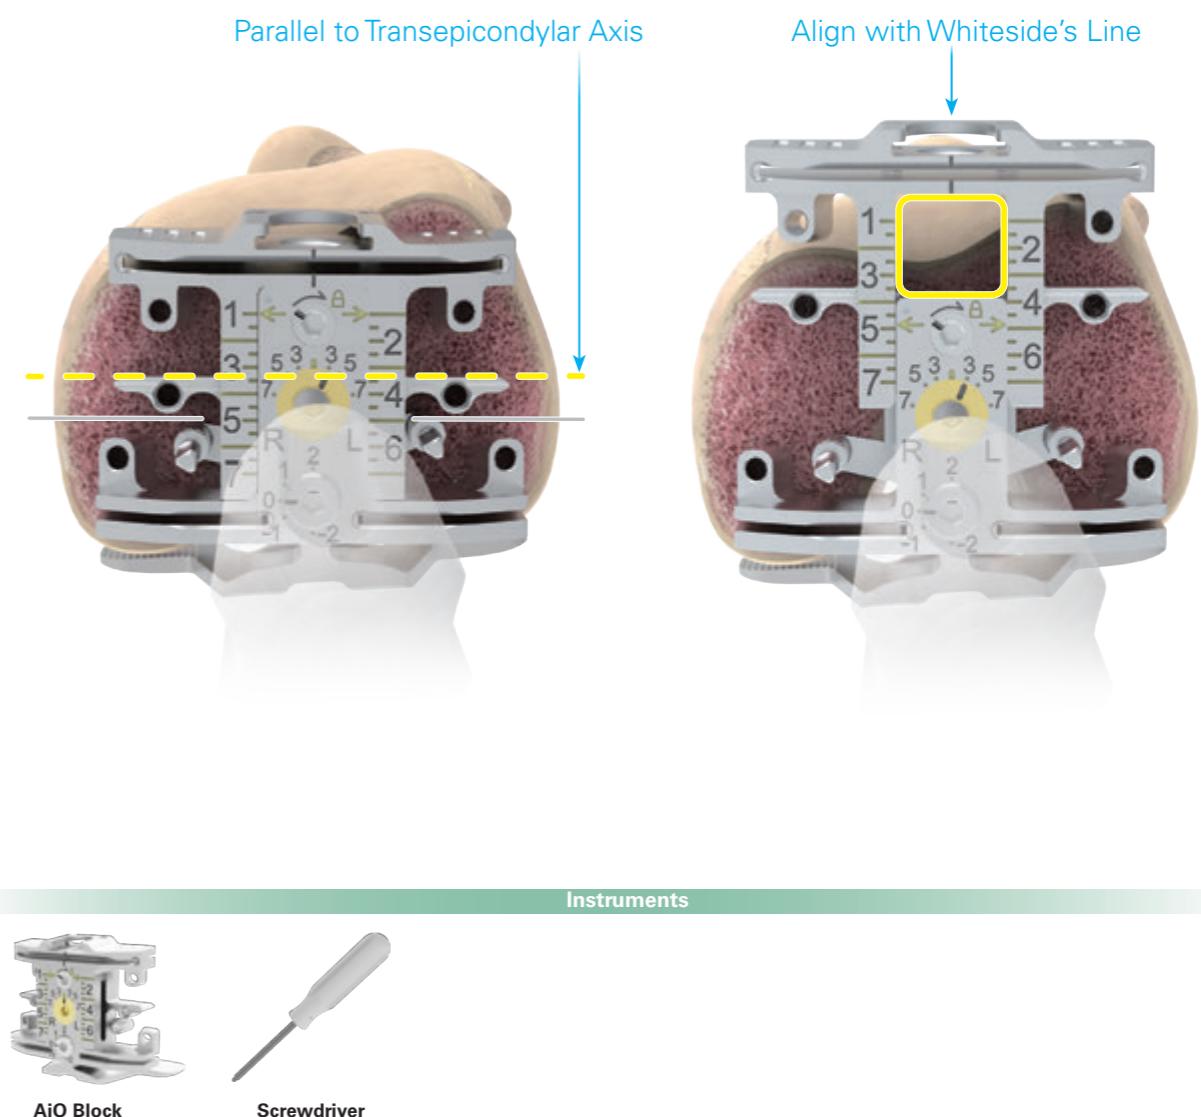

If one posterior condyle is worn excessively, use the **1 mm or 2 mm Gap Spacer** to restore desired posterior condylar thickness.

D.Femoral Sizing and Chamfer Resection

Establish External Rotation

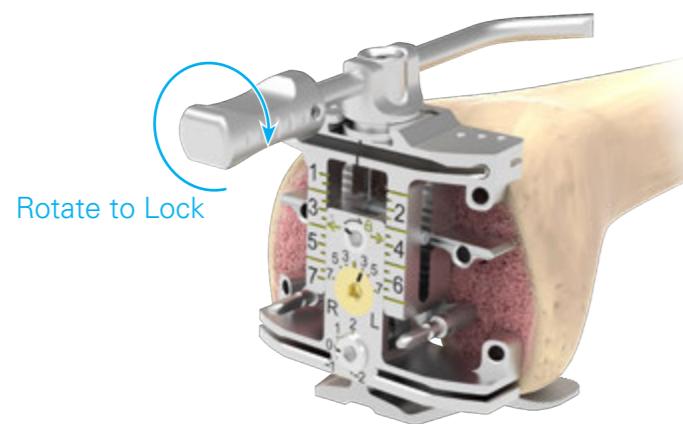

Use the **Screwdriver** to adjust the **Central Knob** to set the desired femoral component rotation angle referencing the transepicondylar axis and Whiteside's Line. The markings on the Central Knob indicate the degrees of rotation vs. the posterior condyles and can be adjusted from 3° to 7° in 1° increments.

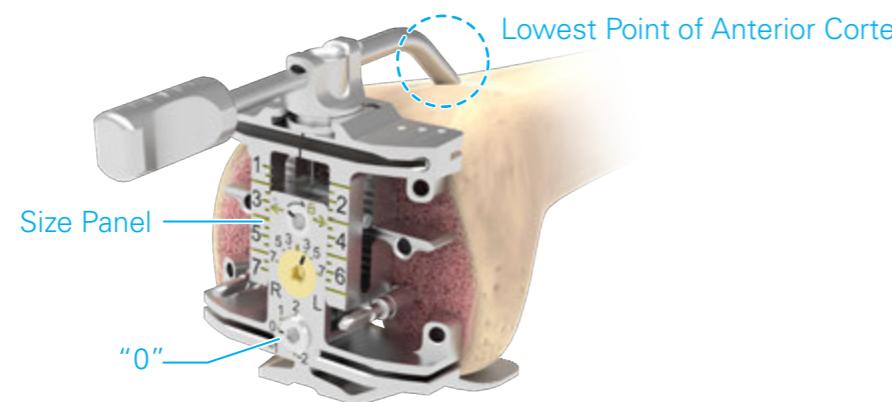

D.Femoral Sizing and Chamfer Resection

Sizing the Femur

Rotate the handle of the **Femoral Stylus** to the unlock position. Then insert the stylus into the slot on the top of the **AiO Block**. Rotate the stylus handle back to the locked position.

Position the stylus tip so it is touching the **lowest point** on the anterior femoral cortex. Check the size panel on the front of the **AiO Block**. If the block is positioned to an exact size and is in proper overall position, proceed to performing femoral resections. If the **AiO Block** is not set to an exact size or is not in proper overall position, adjustments can be made using either an anterior referencing or posterior referencing.

Instruments

AiO Block

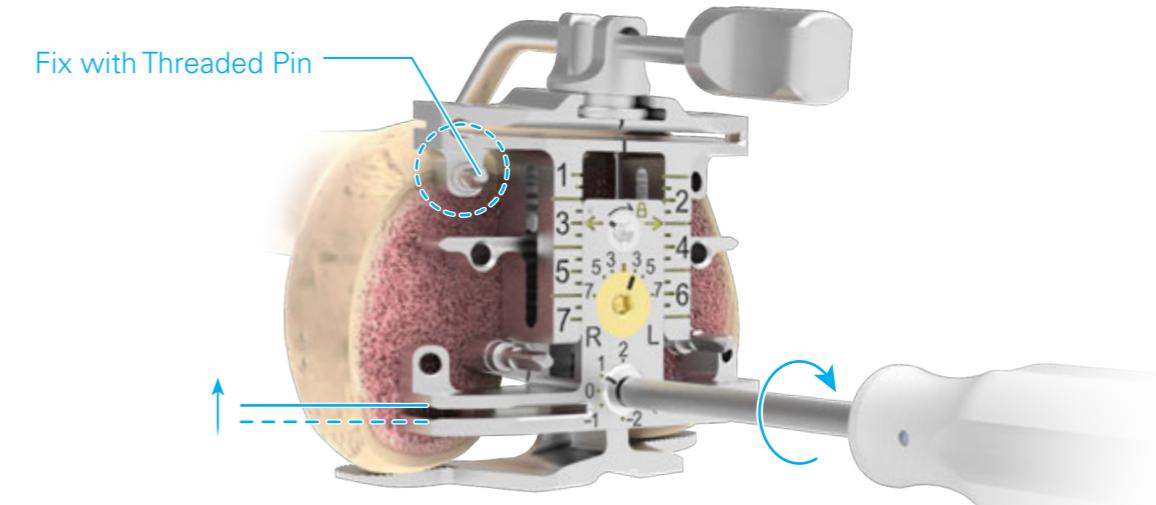

Femoral Stylus

D.Femoral Sizing and Chamfer Resection

Determine the Bone Resection Level

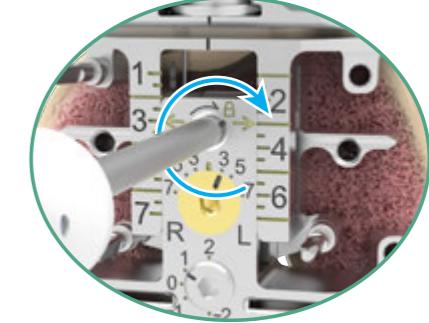

Anterior Referencing:

Secure the **AiO Block** by inserting a **Threaded Pin** in one or both of the Anterior Referencing Fixation Holes. Use the **Screwdriver** to elevate the Posterior Resection Slot to an appropriate position by adjusting the Bottom Knob to match a chosen size. Note the figures on the Bottom Knob indicate the adjustment of the posterior condylar resection level relative to the standard 9 mm resection.

1 mm more posterior cutting

Once the appropriate size is determined, rotate the **Upper knob** to the lock position with the **Screwdriver** to secure the chosen size.

Instruments

AiO Block

Threaded Pin
30 mm/50 mm

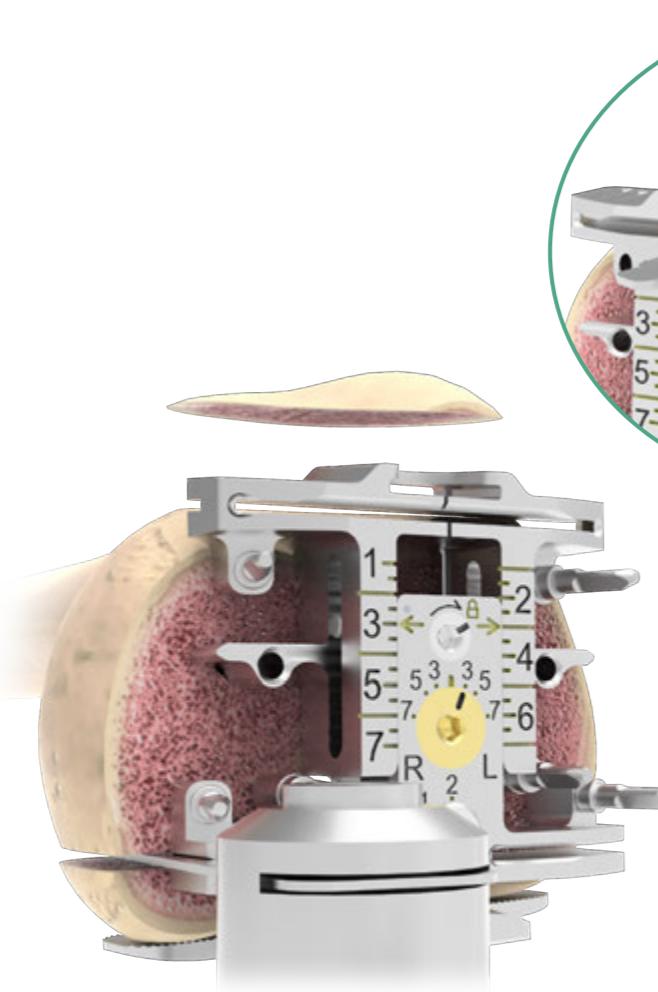

Screwdriver

D.Femoral Sizing and Chamfer Resection

Remove the **Femoral Stylus**, then secure the anterior and posterior slots with **Threaded Pins** and proceed with the anterior and posterior resection.

If desired, use the **Resection Check Blade** to confirm the resection level before bone resection.

Instruments

AiO Block

Femoral Stylus

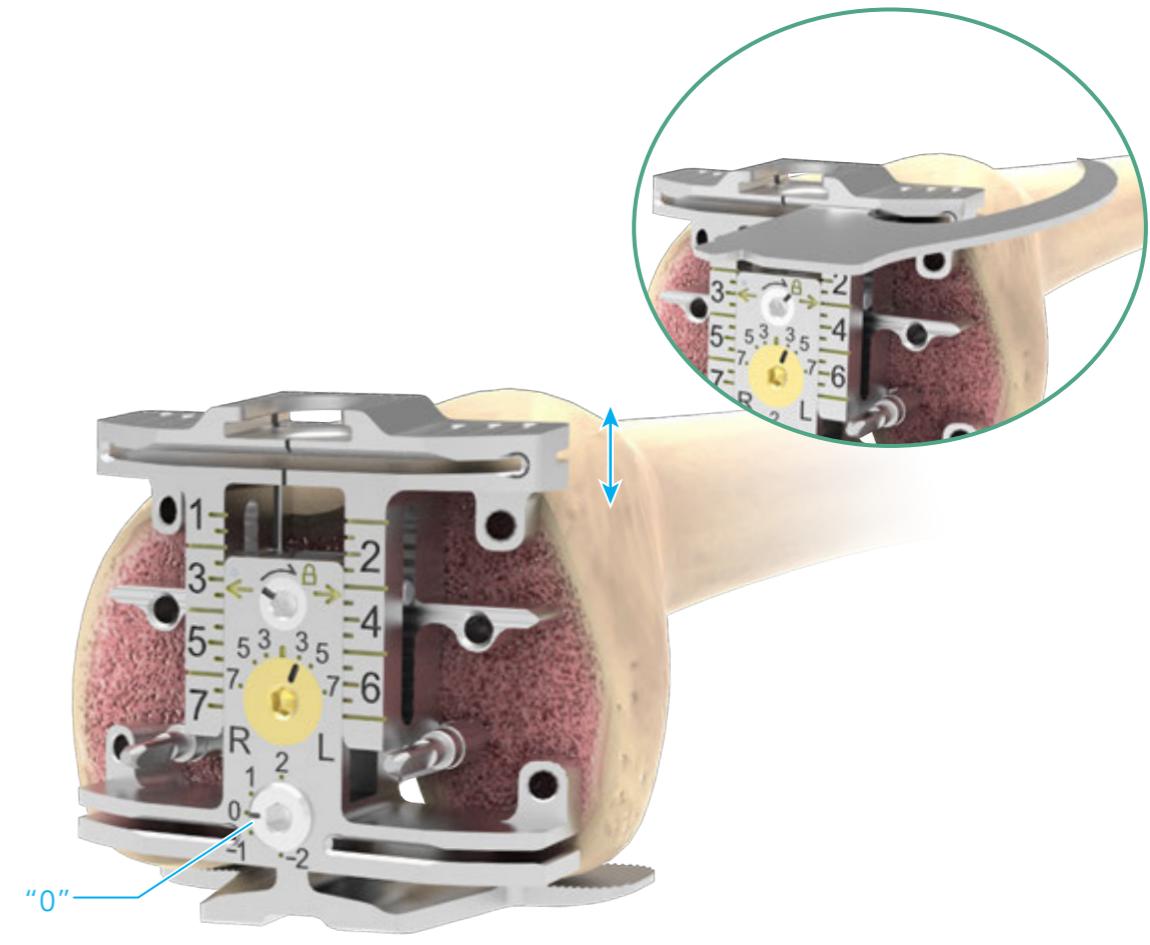

Threaded Pin 30 mm/50 mm
Resection Check Blade

D.Femoral Sizing and Chamfer Resection

Posterior Referencing:

Make sure the bottom knob indicates "0", which refers to the 9 mm standard posterior thickness in the prosthesis. Then remove the **Femoral Stylus**. Slide the anterior slot to match a proper size on the size panel.

Always check the resection level with the **Resection Check Blade**.

Instruments

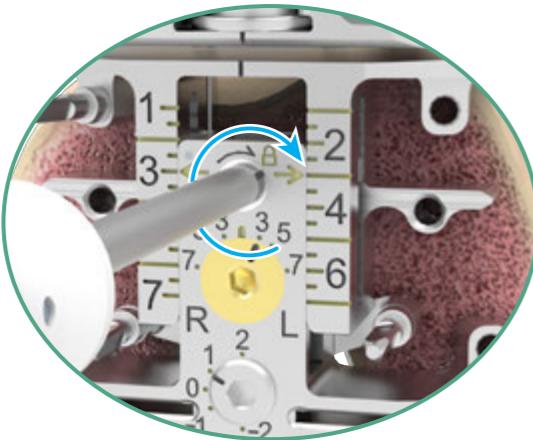

AiO Block

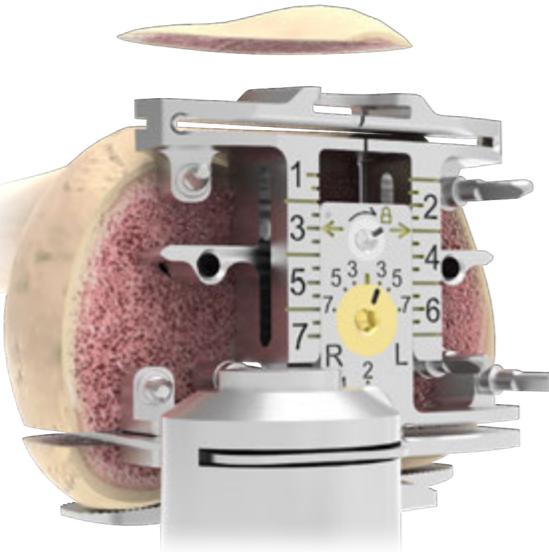

Resection Check Blade

D.Femoral Sizing and Chamfer Resection

Once the size is determined, rotate the upper knob with the **Screwdriver** to the lock position to secure the chosen size and lock the cutting block.

Fix the anterior and posterior slots with **Threaded Pins** and proceed with the anterior and posterior resection.

Instruments

AiO Block

Screwdriver

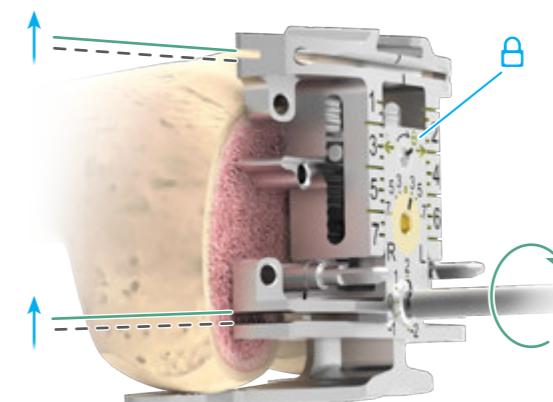

Threaded Pin
30 mm/50 mm

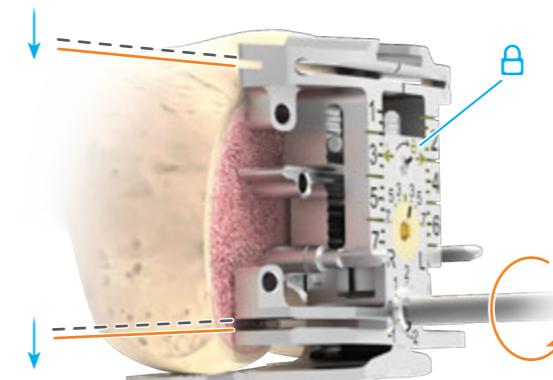

D.Femoral Sizing and Chamfer Resection

Fine Tune

Occasionally, even when the proper size is chosen the desired resection level may be unsatisfactory. If this occurs, a slightly redistributed anterior and posterior bone resection may be considered. With the upper knob in the locked position, use the **Screwdriver** to rotate the bottom knob clockwise to allow for less anterior, and more posterior cut; conversely, rotate the bottom knob counterclockwise to make more anterior and a smaller posterior cut. The range of adjustment is between +2 mm and -2 mm to the standard 9 mm posterior cut.

Clockwise Rotation:
Less Anterior,
More Posterior Resection

Counterclockwise Rotation:
More Anterior,
Less Posterior Resection

Instruments

AiO Block

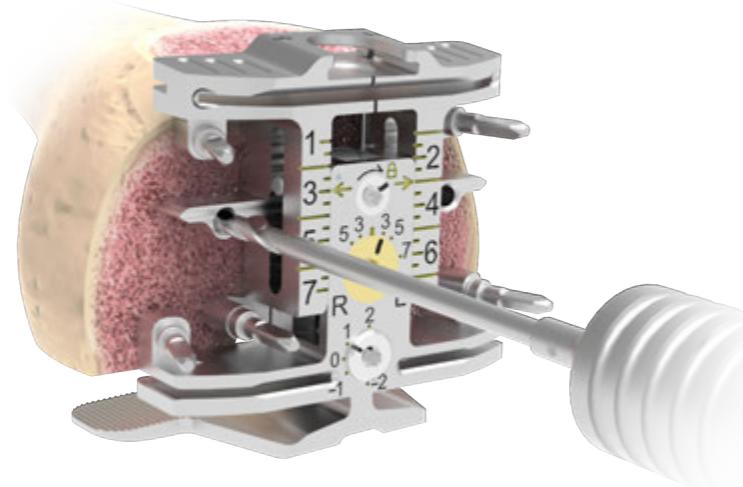

Screwdriver

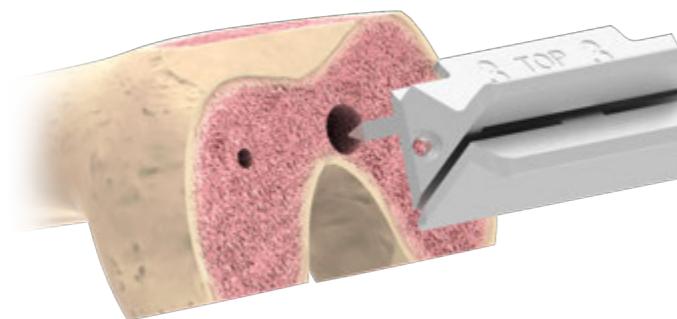

D.Femoral Sizing and Chamfer Resection

Chamfer Cut

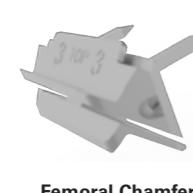

Use the **3.2 mm Drill** to drill two reference holes for the **Femoral Chamfer Resection Guide** before removing the **AiO Block**.

Place the appropriate size **Femoral Chamfer Resection Guide** into the pre-drilled pin holes.

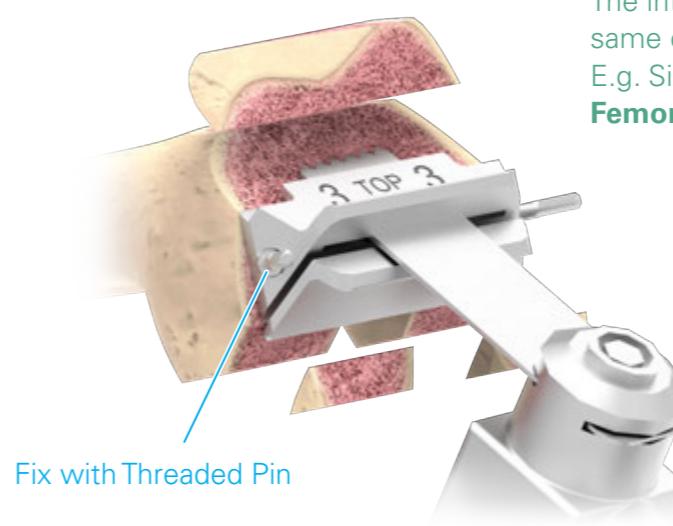

Instruments

D.Femoral Sizing and Chamfer Resection

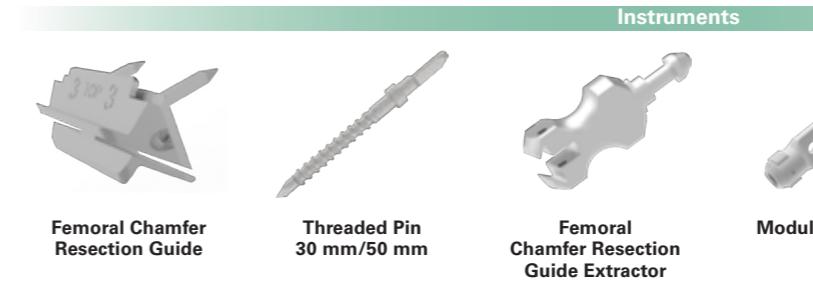

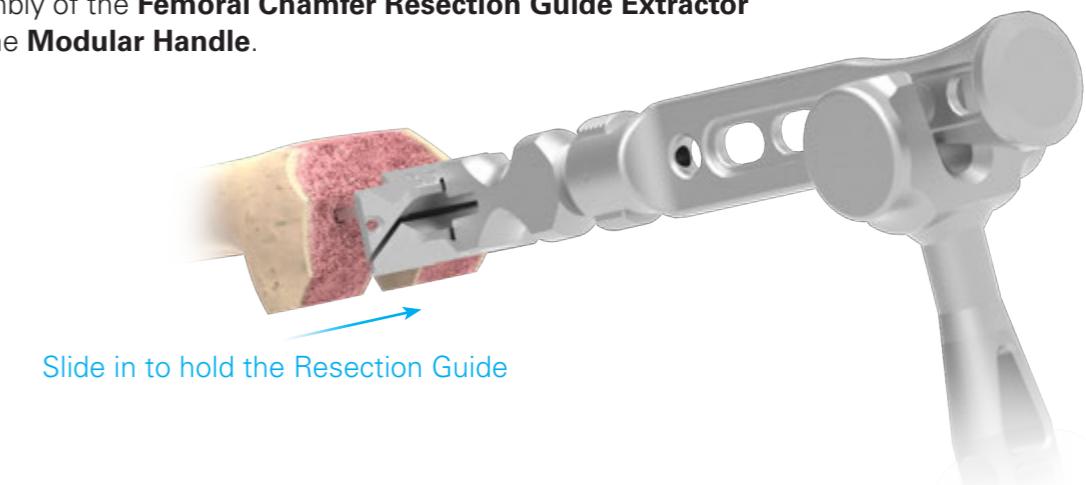

Secure the **Femoral Chamfer Resection Guide** with **Threaded Pins** and then complete chamfer cuts.

Note:

The intermediate femoral sizes shares the same chamfer resection guide to integral size. E.g. Size 3.5 and Size 3 both use Size 3 **Femoral Chamfer Resection Guide**.

Femoral Chamfer Resection Guide can be removed via the assembly of the **Femoral Chamfer Resection Guide Extractor** and the **Modular Handle**.

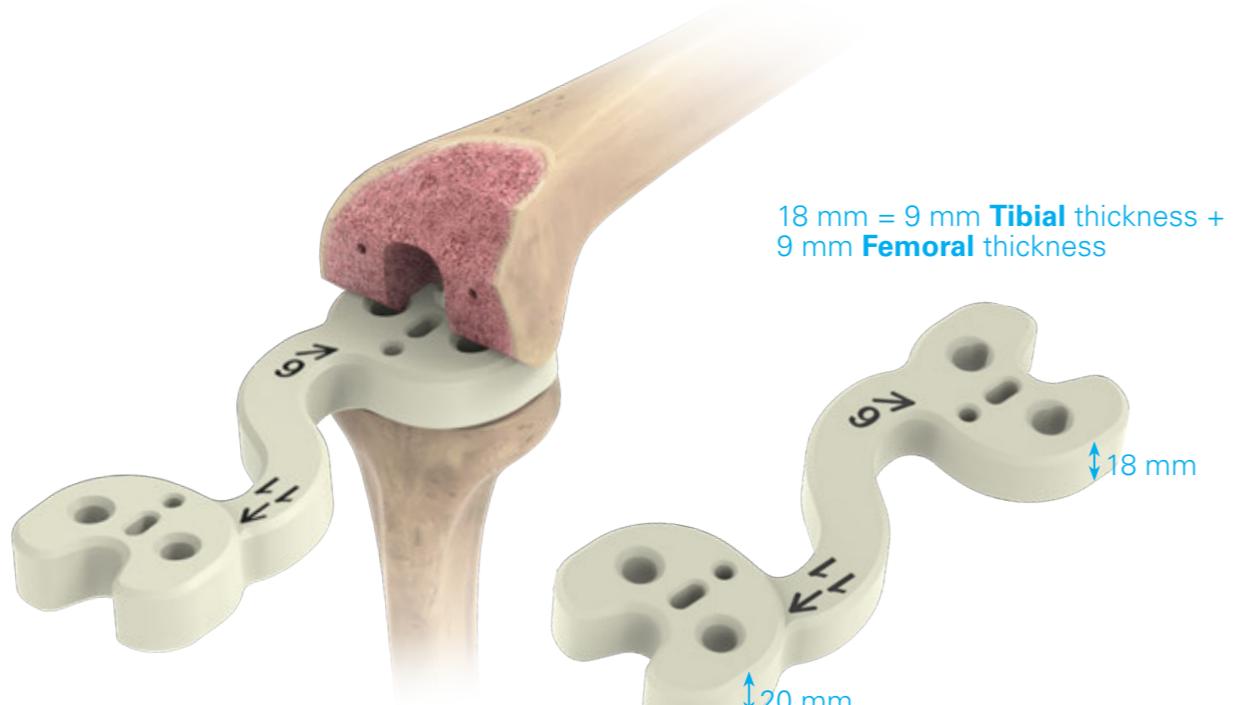

E. Extension and Flexion Gaps Confirmation

The extension and flexion joint gaps may be evaluated with the **Gap Gauge**. Select the 9 mm **Gap Gauge** initially to assess both the extension and flexion joint gaps. If a thicker gap is required, combine additional Gap Gauge Blocks with different thicknesses and test again. The range of thickness is from 9 mm to 18 mm. If the assessed femoral and extension gaps are optimal, insert the femoral and tibial trials to test overall knee mobility and their relative implant position.

 **Note:**

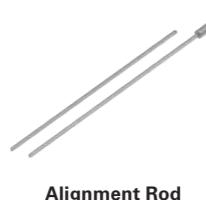

The **Alignment Rod** may be inserted through the Gap Gauge handle to assess the extramedullary alignment in both extension and flexion.

Instruments

F.Trial Reduction

With Modular Disposable Trial (MDT)

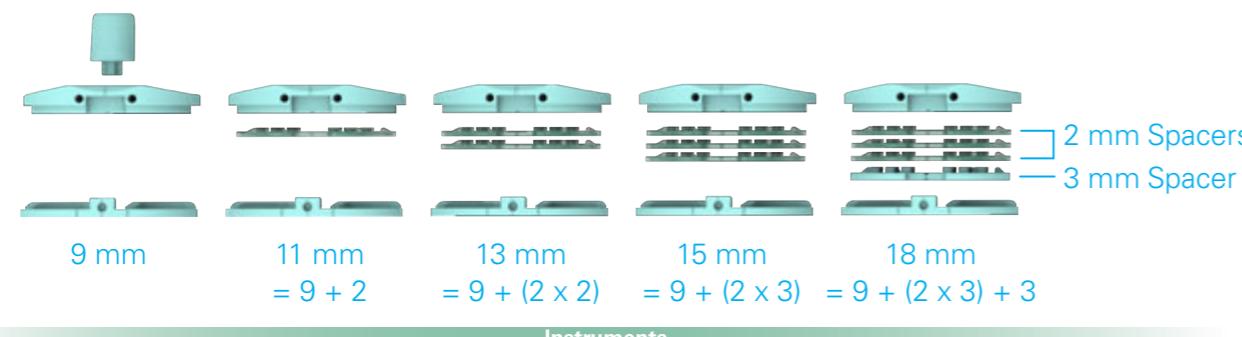

Select the proper single-use **Modular Disposable Trial (MDT)** set based on the selected femoral component size.

Connect the **CR Notch Trial** to the **Femoral Trial**. If using a CR system, this will remain in place. If using a PS system, leave the **CR Notch Trial** in place at the initial trial reduction, then remove for PS Box Preparation (The PS Box Trial will be used after PS Box Preparation).

2 mm or 3 mm **Spacers** can be used to stack up desired insert trial thickness. Additionally, the **PS Post Trial** can be used to convert the CR insert trial into PS insert trial.

H.PS Box Preparation

Position the PS Notch Cutting Jig with Modular Disposable Trial (MDT)

Remove the **CR Notch Trial** with the **Femoral Trial** left in position on the femur.

Attach the **PS Notch Cutting Jig** to the **Femoral Trial**. Secure with up to three **Threaded Pins** as needed to confirm fixation.

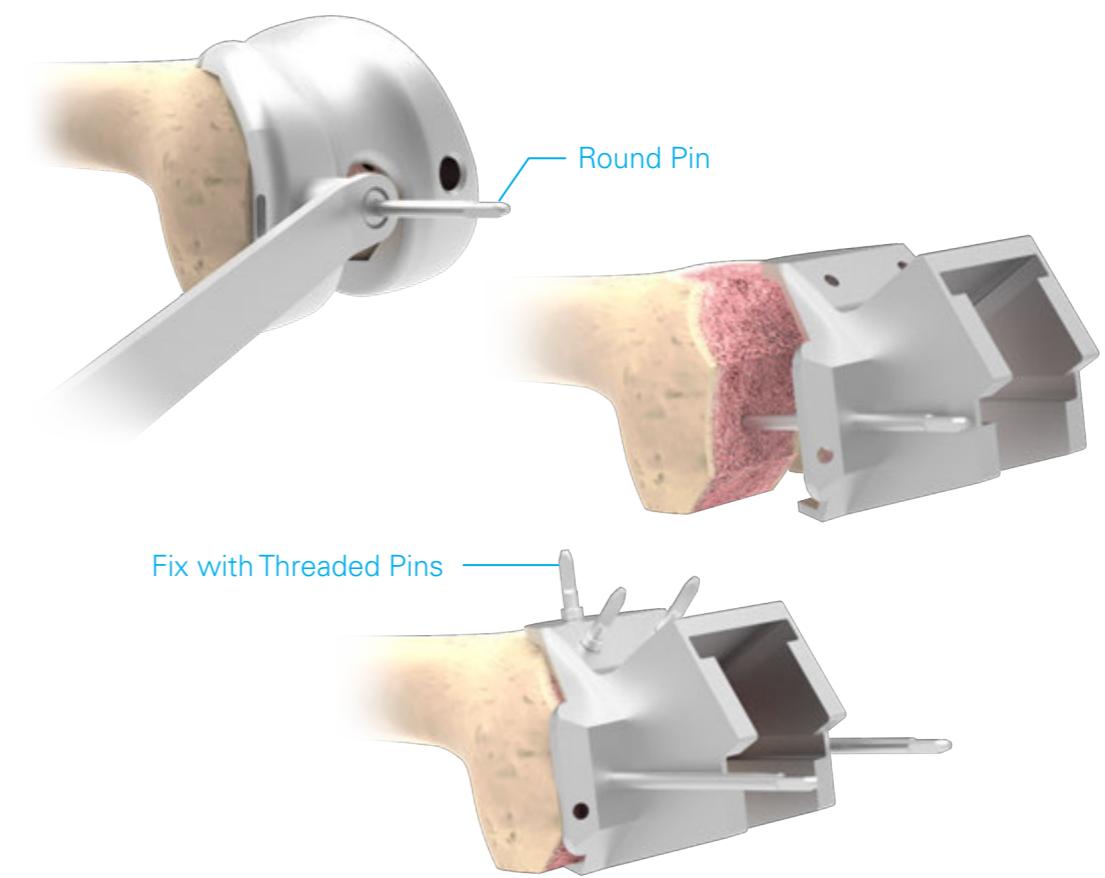

Position the PS Notch Cutting Jig with Reusable Trials

Use of the Reusable Femoral Trial and PS Box Cutting Jig:

With the reusable **CR Femoral Trial** in place, insert the **PS Cutting Jig Drill Guide** onto one fixation peg hole. Drill a pilot hole with **3.2 mm Drill** through the pin hole on the drill guide and place a **Round Pin** through the drill guide to further position the **PS Notch Cutting Jig**.

Remove the **CR Femoral Trial** and secure the **PS Notch Cutting Jig** with **Threaded Pins**. The M/L width of **PS Notch Cutting Jig** is the same as the M/L width of the implant.

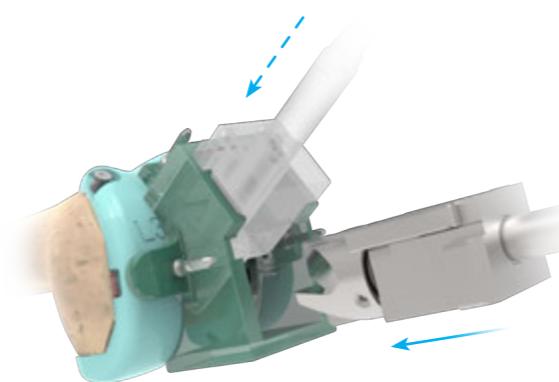

H.PS Box Preparation

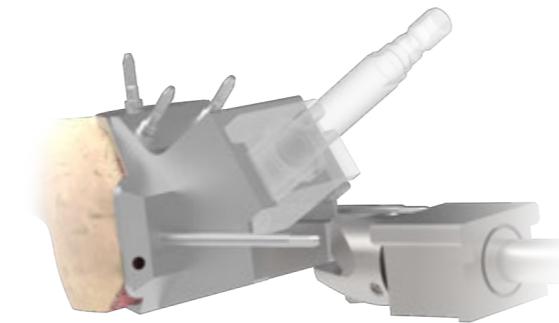

Prepare PS Box

Attach the **PS Reamer** to a drill and insert into the anterior guide slot on the **PS Notch Cutting Jig**. Ream until fully engaged with the stopping point. Repeat for the posterior guide slot.

With Modular Disposable Trial (MDT)

With Reusable Trials

The **Slotted Hammer** can be used to disengage both the punch and the impactor from the cutting jig.

J.Onset Patellar Preparation

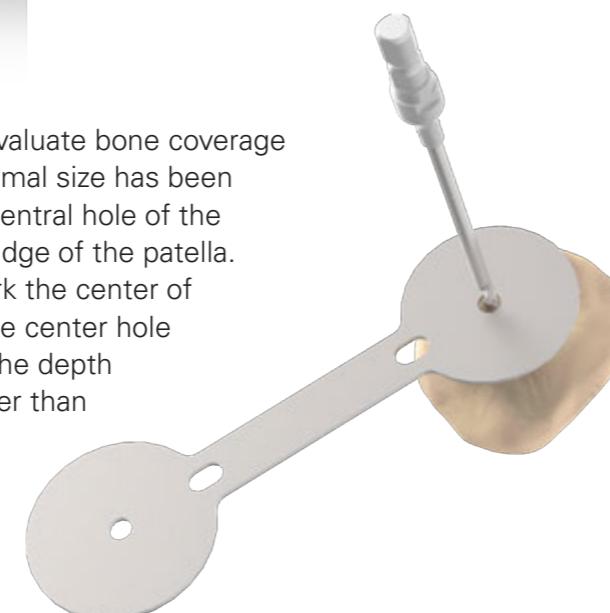

Patella Sizing and Bone Resection

Place the knee in full extension and evert the patella with caution. Remove the excess cartilage and osteophytes adjacent to the border of patella. Use the **Caliper** to measure the anterior-posterior dimension of the patella.

Use the **Onset Patella Sizing Rings** to evaluate bone coverage and select the optimal size. Once the optimal size has been selected, set positioning by locating the central hole of the sizing ring with the center of the medial ridge of the patella. While holding the sizing ring in place, mark the center of the implant by carefully drilling through the center hole of the sizing ring with the **3.2 mm Drill**. The depth of the drilled hole should be slightly deeper than the thickness of the implant size chosen.

Onset Patellar Sizing Ring Diameter:
26,29,32,35,38,41,44 mm

Instruments

Caliper

Onset Patella
Sizing Ring

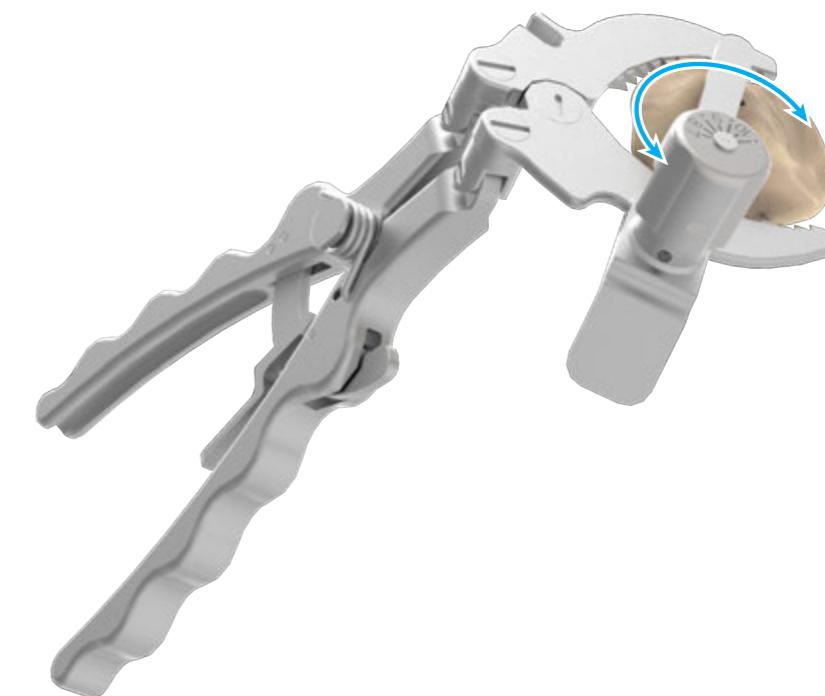

3.2 mm Drill

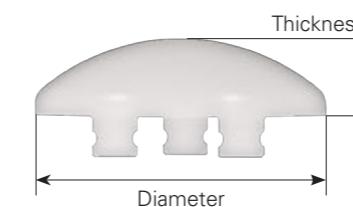

J.Onset Patellar Preparation

The **Patella Stylus** can be attached to the **Onset Patellar Resection Guide** to indicate proper resection from the highest point of patella. Rotate the quick dial on the **Patella Stylus** to select the desired resection that corresponds to the thickness of the implant.

Grasp the patella firmly with the jaws of the resection guide.

Onset Patellar Component

Size	XS	S	M	L	XL	XXL	EL
Thickness	7	8	8.5	9	9.5	10	10.5
Diameter	26	29	32	35	38	41	44

Unit:mm

Resection Guide

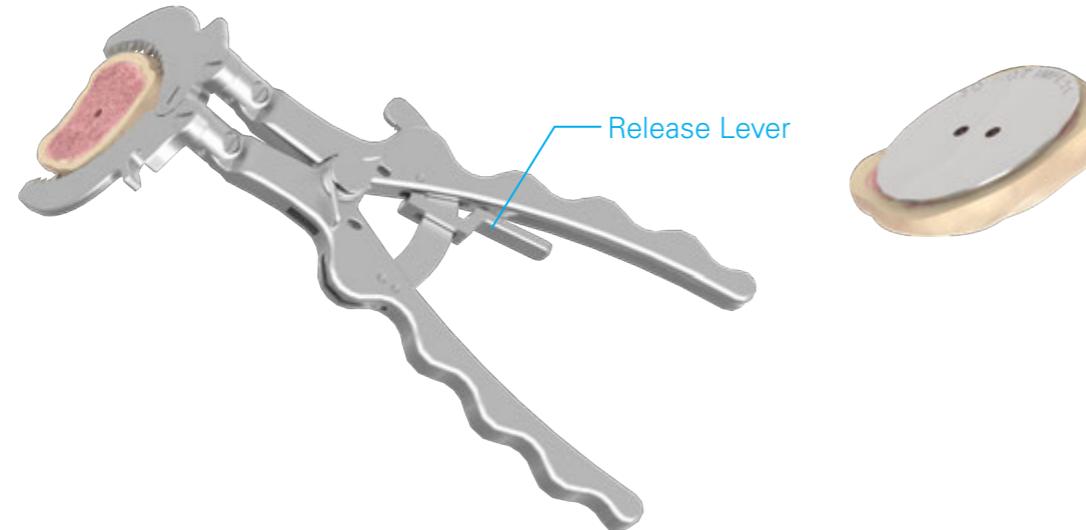

Patella Stylus

J.Onset Patellar Preparation

The resection can be performed with or without the **Slot Attachment**.

Disengage the resection guide by pressing the release lever.

If necessary, place an appropriate size **Patella Protector** to temporarily seal the bone bed.

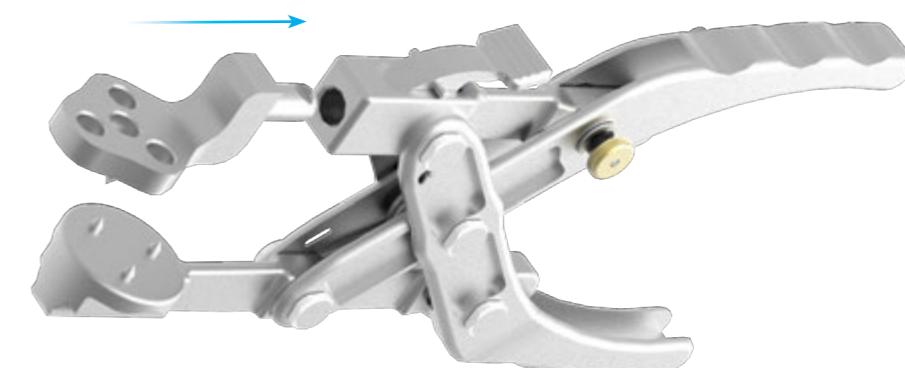

Instruments

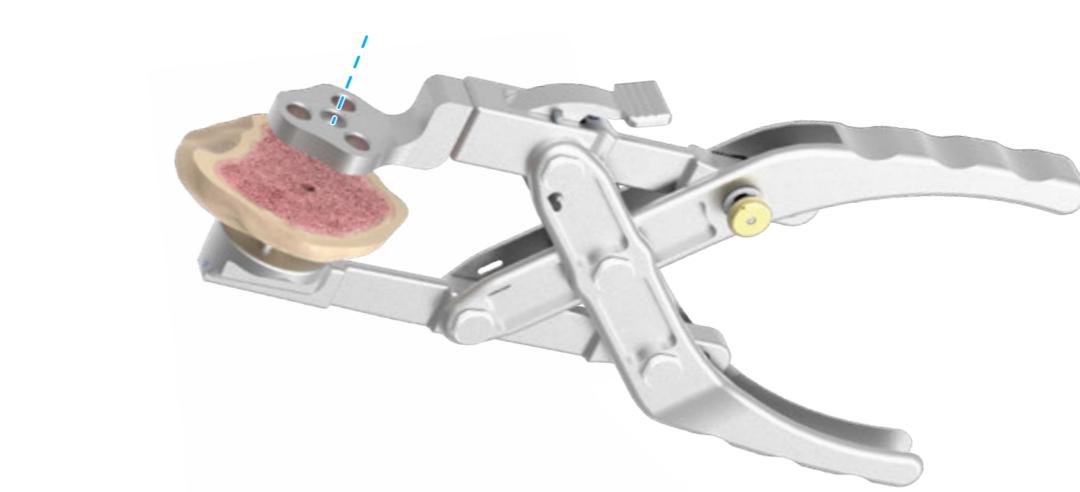

J.Onset Patellar Preparation

Patellar Preparation and Trialing

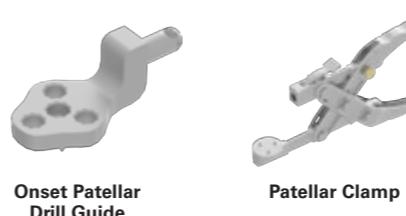

Assemble the **Onset Patellar Drill Guide** to the **Patellar Clamp**.

Align the center hole of the drill guide with the pre-drilled hole. Secure the clamp to the patella by depressing the handles on the clamp.

Instruments

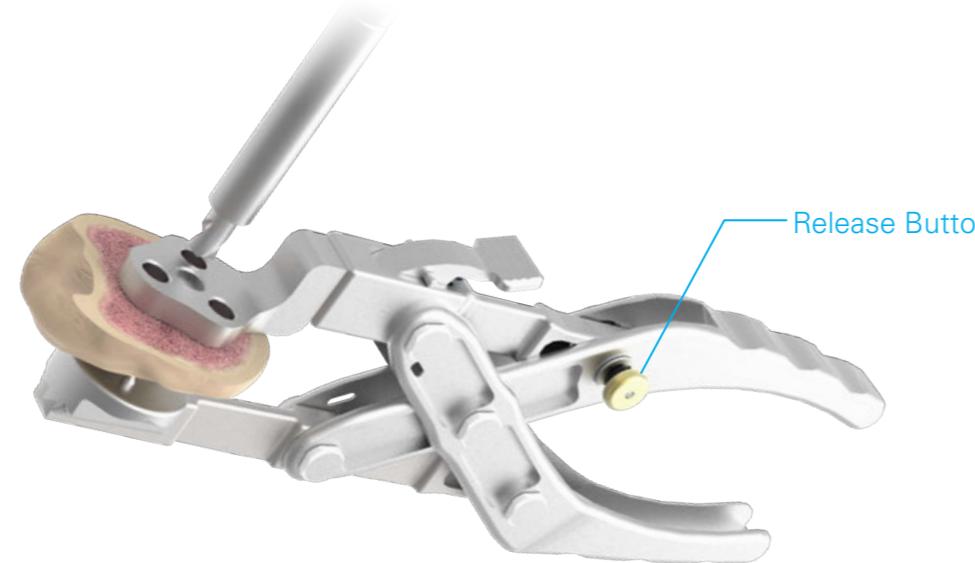

Onset Patellar Drill Guide

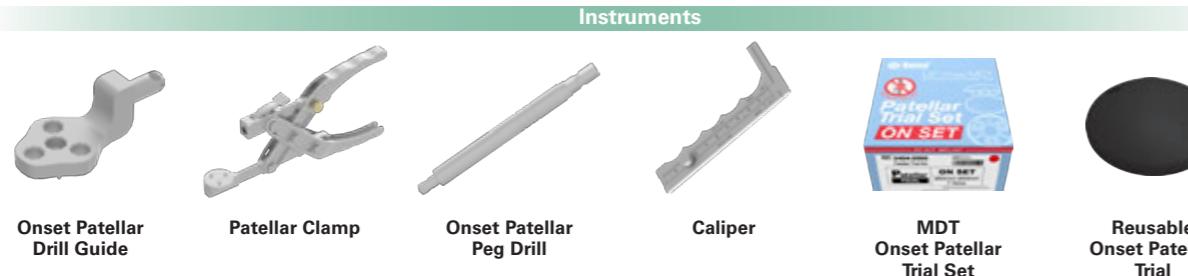

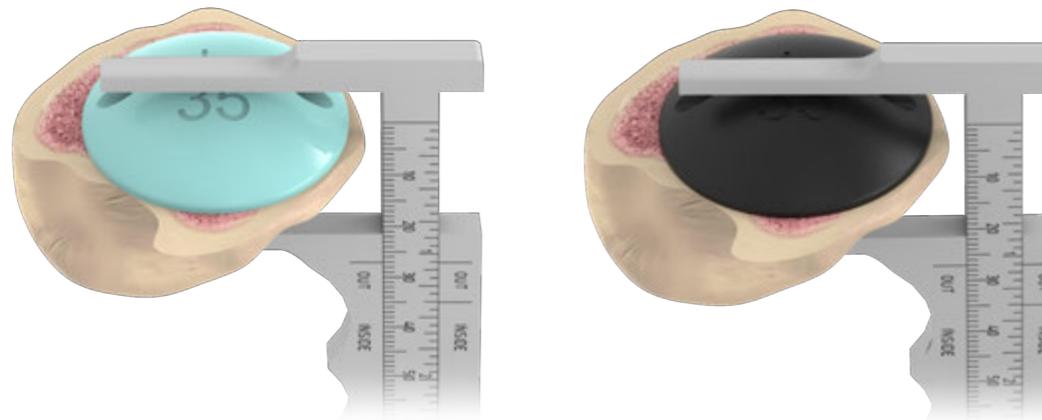

Patellar Clamp

J. Onset Patellar Preparation

Drill three peg holes with the **Onset Patellar Peg Drill** (Diameter 5.5 mm). Release the clamp by pressing the release button.

Place the **Onset Patellar Trial** in place and confirm the restored patellar AP thickness.

K. Inset Patellar Preparation

Patella Sizing and Bone Resection

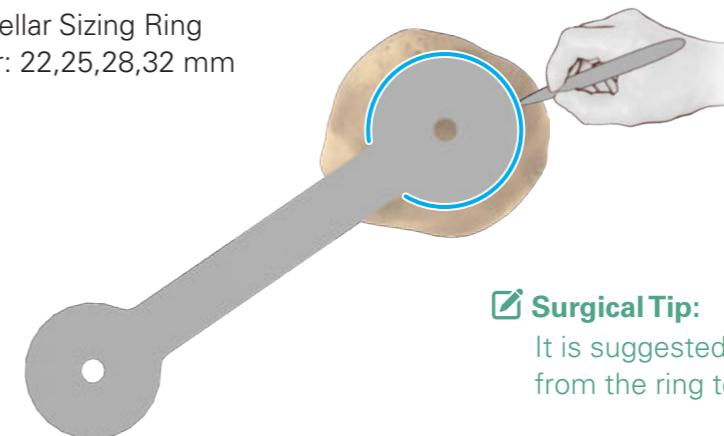

Place the knee in full extension and evert the patella with caution. Remove the excess cartilage and osteophytes adjacent to the border of patella.

Use the **Caliper** to measure the anterior-posterior dimension of the patella.

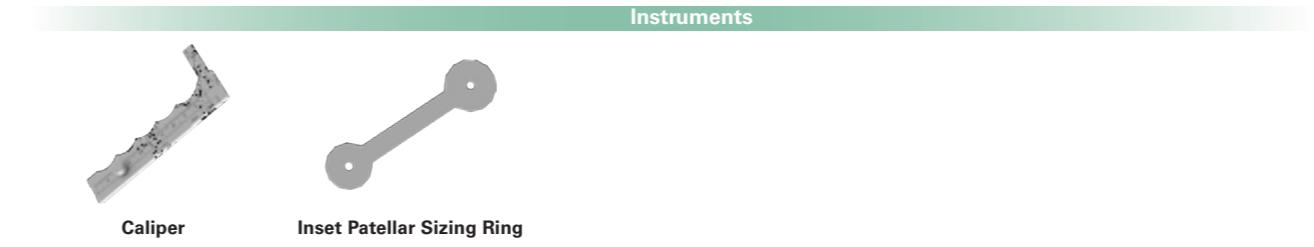

Use the **Inset Patellar Sizing Rings** to evaluate bone coverage and select the optimal size. Once the optimal size has been selected, set positioning by locating the central hole of the sizing ring with the center of the medial ridge of the patella. While holding the sizing ring in place, mark the outer border of the selected sizing ring.

Inset Patellar Sizing Ring
Diameter: 22,25,28,32 mm

Surgical Tip:

It is suggested to leave at least 2 mm from the ring to the border of the patella.

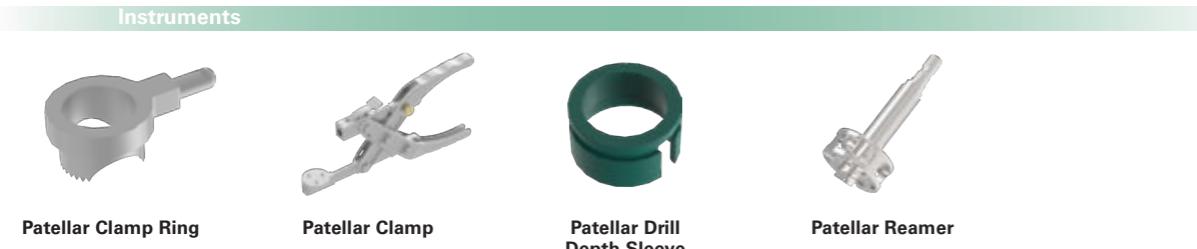

K. Inset Patellar Preparation

Inset Patellar Reaming Depth and Pilot Hole

Attach the appropriate size **Patellar Clamp Ring** to the **Patellar Clamp**.

Align the **Patellar Clamp Ring** on the patella clamp to the previously marked position and secure to the patella by depressing the handles on the clamp. Choose the **Patellar Drill Depth Sleeve** that corresponds to the selected patella size and place over the clamp ring. Insert the **Patella Reamer** into the Patella ring until the tip is touching the patella.

K. Inset Patellar Preparation

Use the **Screwdriver, Hex 5** to assemble the **Patellar Reamer Stopper** onto the **Patellar Reamer** with the stopper seated on the depth sleeve. This will ensure the drill depth of the reamer equals the patellar component thickness.

Remove the **Patellar Depth Sleeve** and the **Patella Reamer**, leaving the **Patellar Reamer Stopper** attached to the reamer.

Insert the **Patellar Drill Guide** that corresponds to the selected **Patellar Clamp Ring**. Advance the **Patellar Drill** (Diameter 9.45 mm) and create a pilot hole for the **Patellar Reamer**.

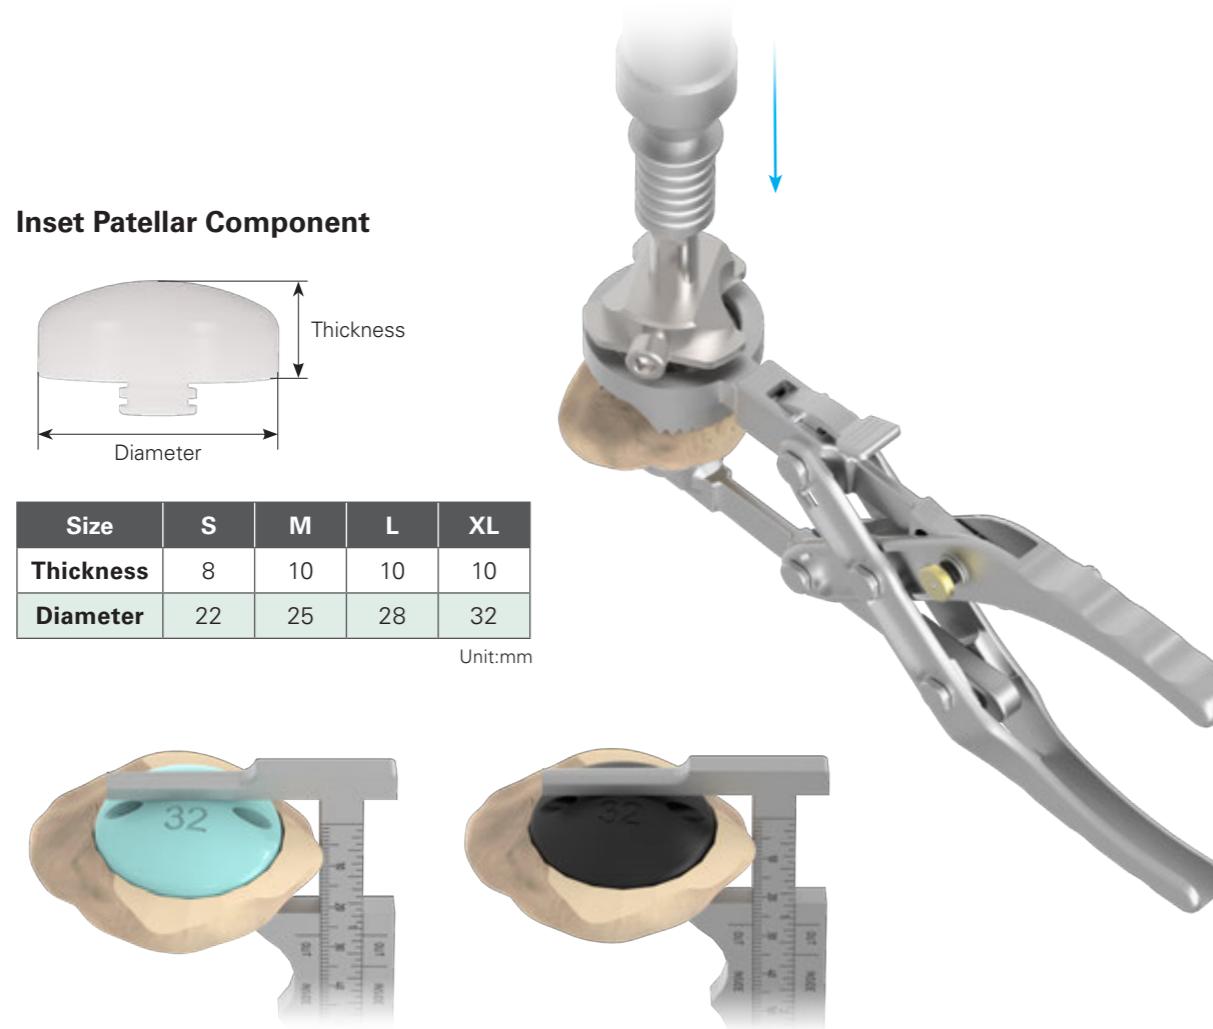

K. Inset Patellar Preparation

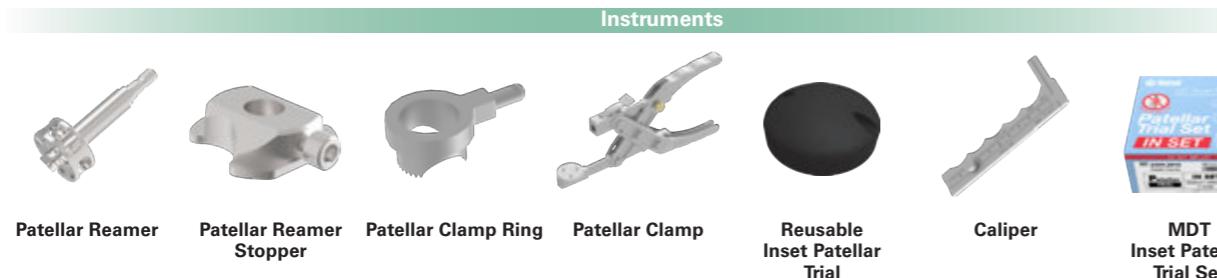

Re-insert the **Patellar Reamer** into the **Patellar Clamp Ring** and ream out the proper depth of bone to create the inset bone bed.

 **Note:**

A minimum bone thickness of 10 mm should be maintained. For a thinner patella, the position of the **Patellar Reamer Stopper** on **Patella Reamer** may need to be manually adjusted to ensure sufficient bone bed thickness.

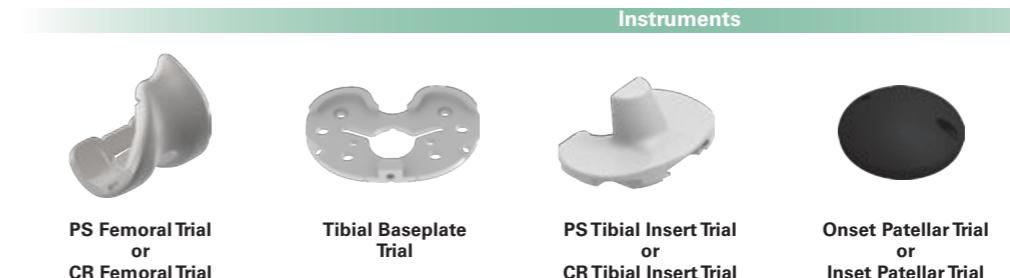

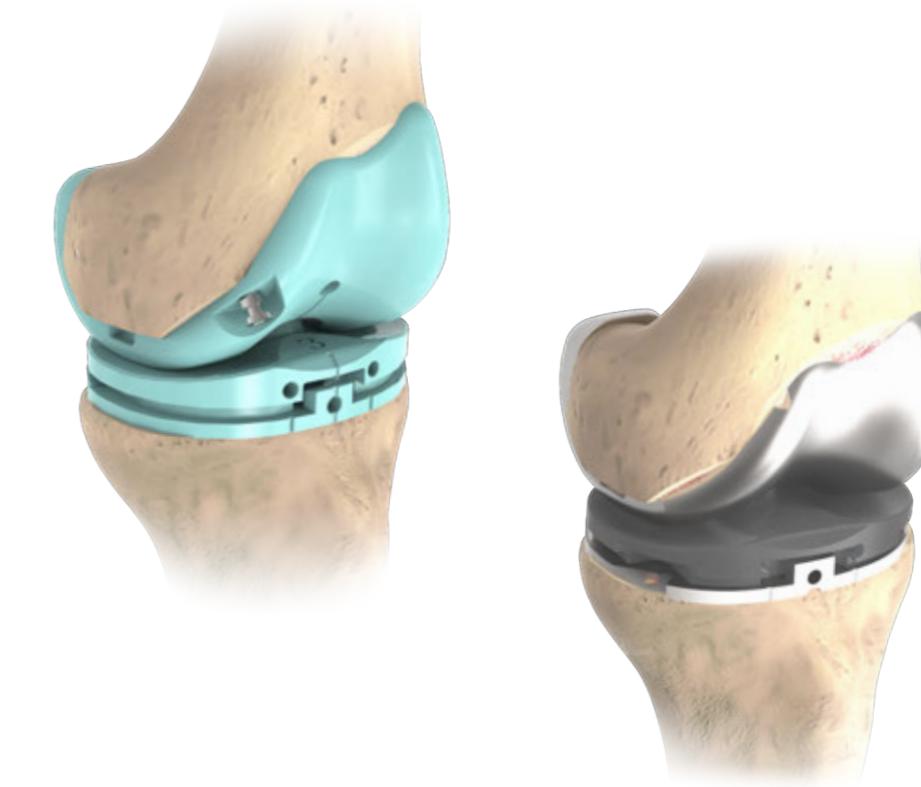

Place the **Inset Patellar Trial** in place and confirm the restored patellar AP thickness.

L. Implantation

Final Trial Reduction

Affix the **Patellar Trial**, **Femoral Trial**, **Tibial Baseplate Trial**, and **Tibial Insert Trial** to the corresponding resected bony surfaces. Test for joint laxity and range of motion. Observe how the muscles and ligaments react in extension and flexion. Manage the soft tissue tension to ensure ideal joint stability and mobility. Remove all trials and clean the resected bone surfaces.

L. Implantation

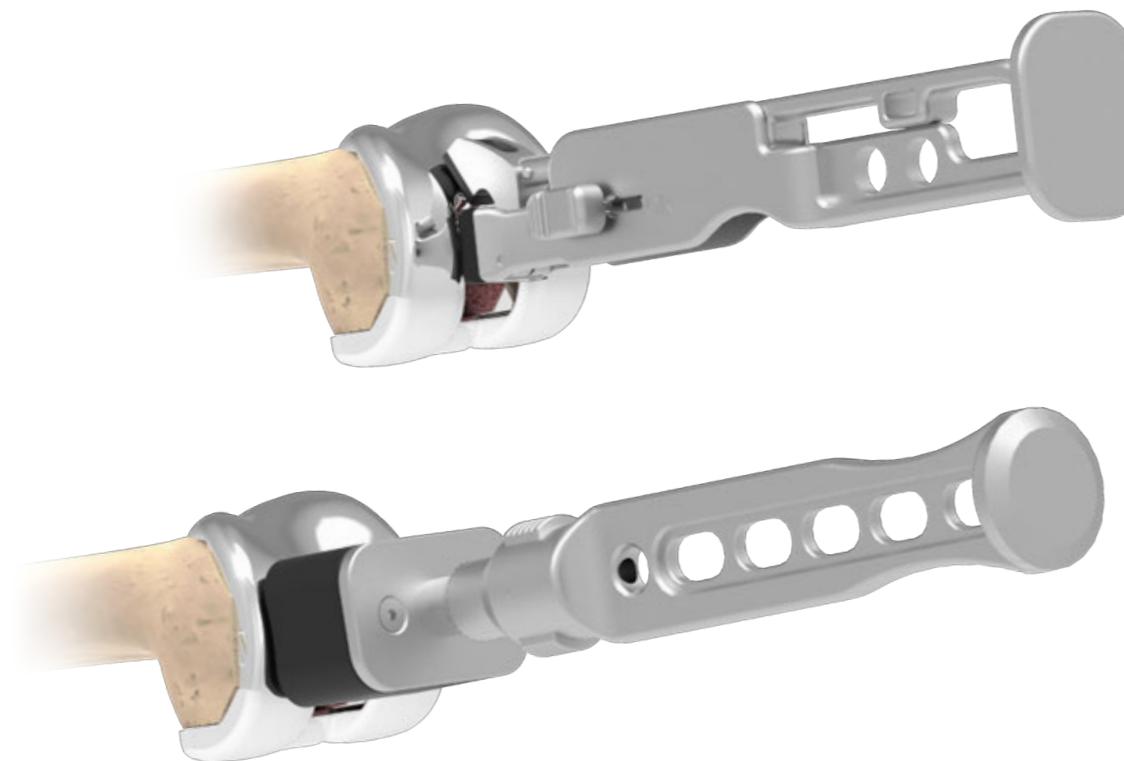

Femoral Component Implantation

Mix and prepare bone cement in the usual fashion for the femoral component and femoral bone surface. Attach the femoral component to the **Femoral Driver** and press against the prepared femoral bone surface until the component is flush with the bone.

Attach the **Femoral Impactor** to the **Modular Handle** and strike the femoral component to firmly seat it in place against the femoral bone surface. Use an instrument such as a curette to remove any excess, extruded cement.

Caution:

The Femoral Driver is designed to position the implant and trial, not for final impaction. Please **impact gently** to avoid instrument breakage.

Appendix

Preparing Augment and Extension Stem for CMA Baseplate

(with Optional CMA Augment and Extension Stem Tray)

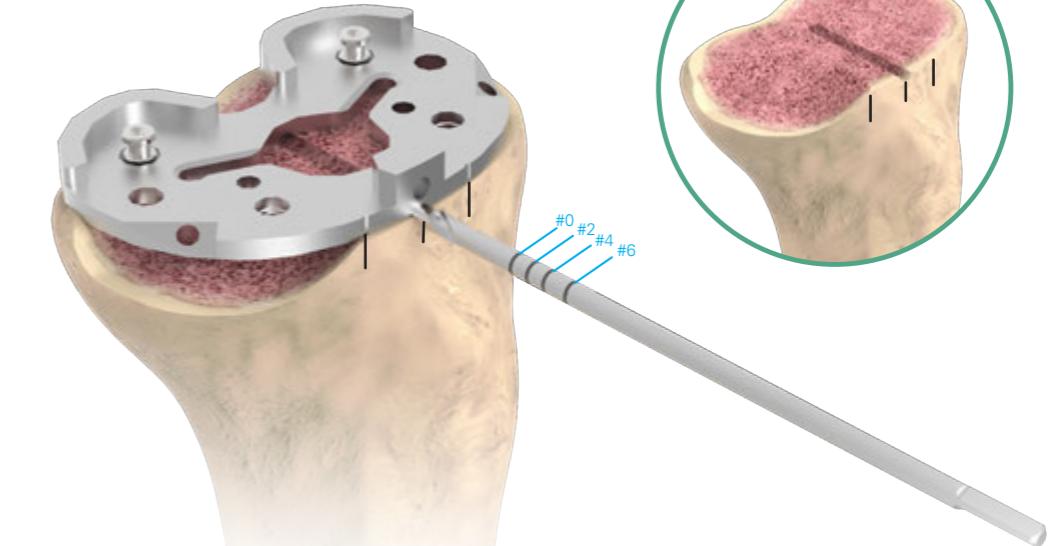

The U2 Knee System incorporates an optional CMA instrument tray to address moderate tibial defects. Use this Appendix in place of Section I. Proximal Tibial Preparation listed earlier in this guide

Align the **Tibial Baseplate Trial** with resected tibia surface and secure the baseplate trial to the proximal tibia with two **Head Pins** according to the rotational orientation.

Use the **CMA 3.2 mm Drill** to drill carefully through the center tunnel below the **Tibial Baseplate Trial**. Stop drilling when the marked depth according to desired size of tibial baseplate has been reached. A center groove on the proximal tibia plane is formed as a vertical resection reference.

Caution:

Avoid drilling passed the marked depth to avoid soft tissue damage.

Instruments

Tibial Baseplate Trial

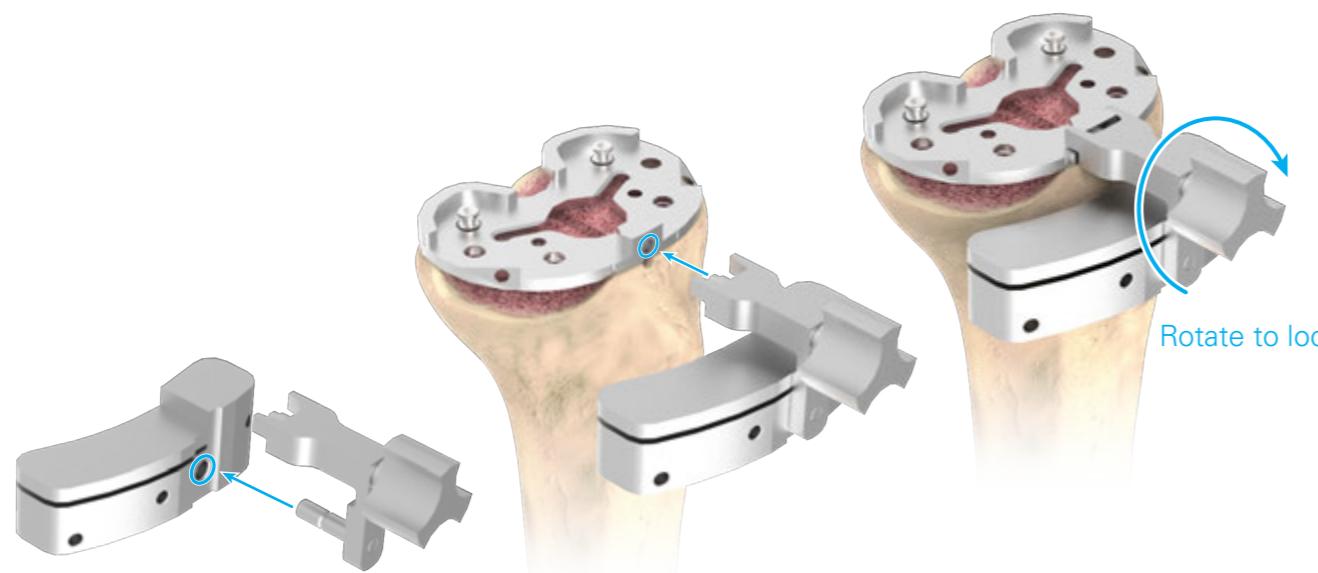

Head Pin

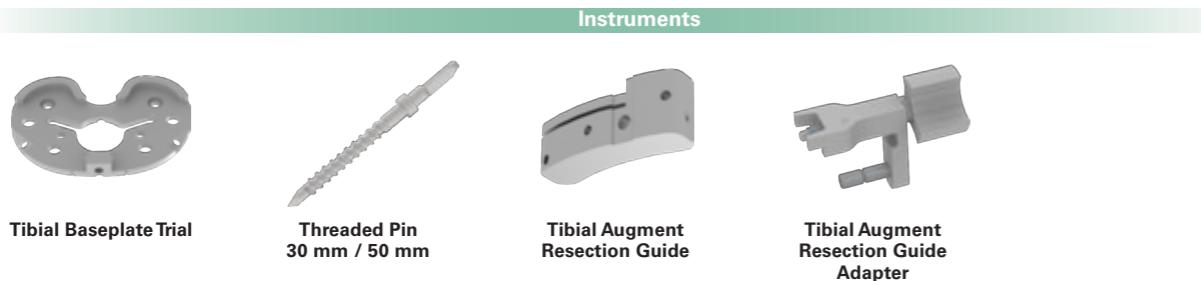

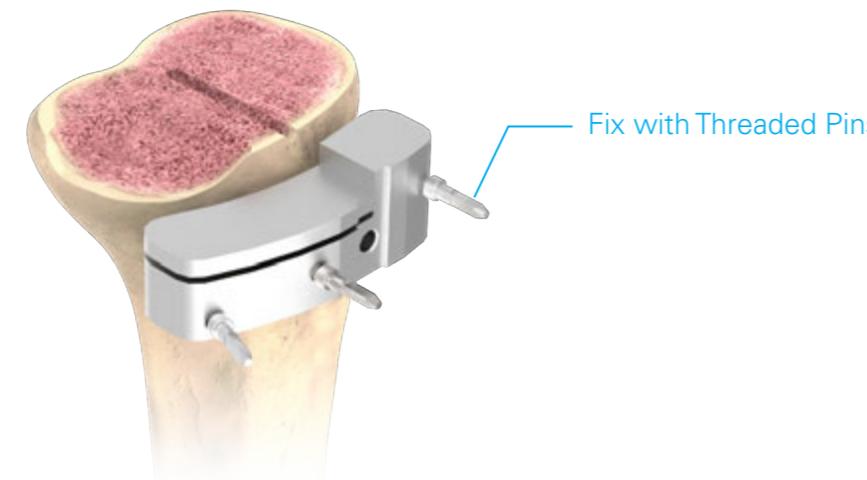

CMA 3.2 mm Drill

Appendix

Assemble the appropriate **Tibial Augment Resection Guide** (left or right) and the **Tibial Augment Resection Guide Adapter** to the baseplate trial.

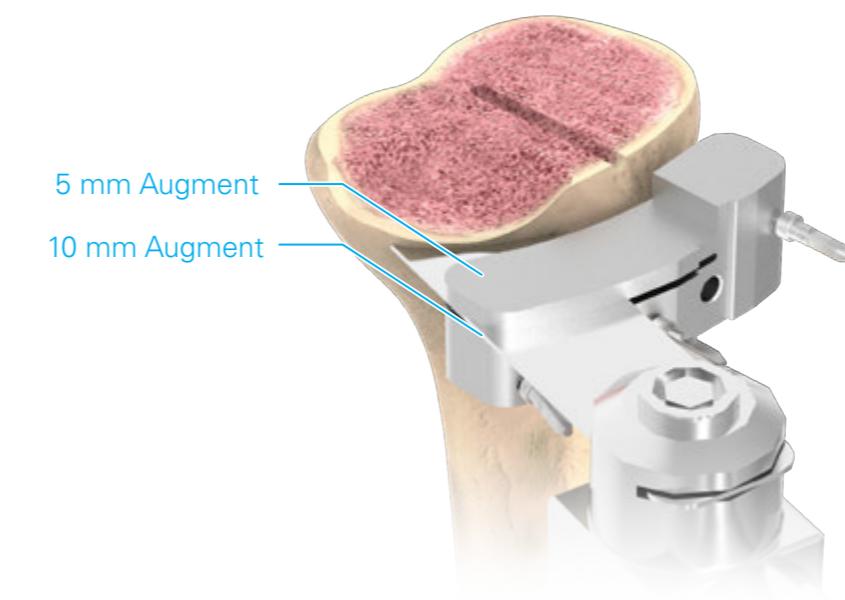

Apply the **Threaded Pins** to secure the **Tibial Augment Resection Guide** to the tibia. Then, remove the **Tibial Augment Resection Guide Adapter** and the **Tibial Baseplate Trial**.

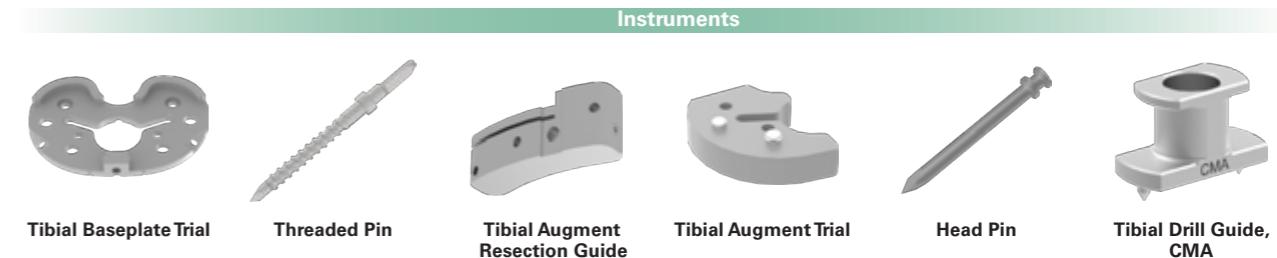

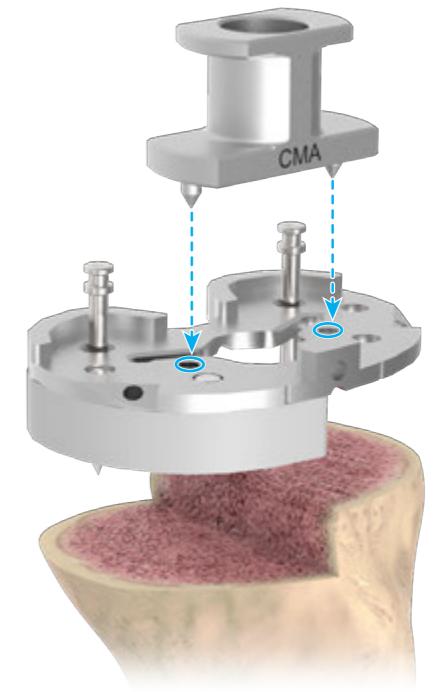

Appendix

Perform the horizontal resection by referencing the upper plane for 5 mm augment or the slot for 10 mm augment. Finish the vertical resection referring to the center groove on the top of proximal tibia plane with osteotome or reciprocating saw.

Assemble the desired **Tibial Augment Trial** to the backside of the **Tibial Baseplate Trial** and fix the trial combination onto the resected tibial surface with two **Head Pins**.

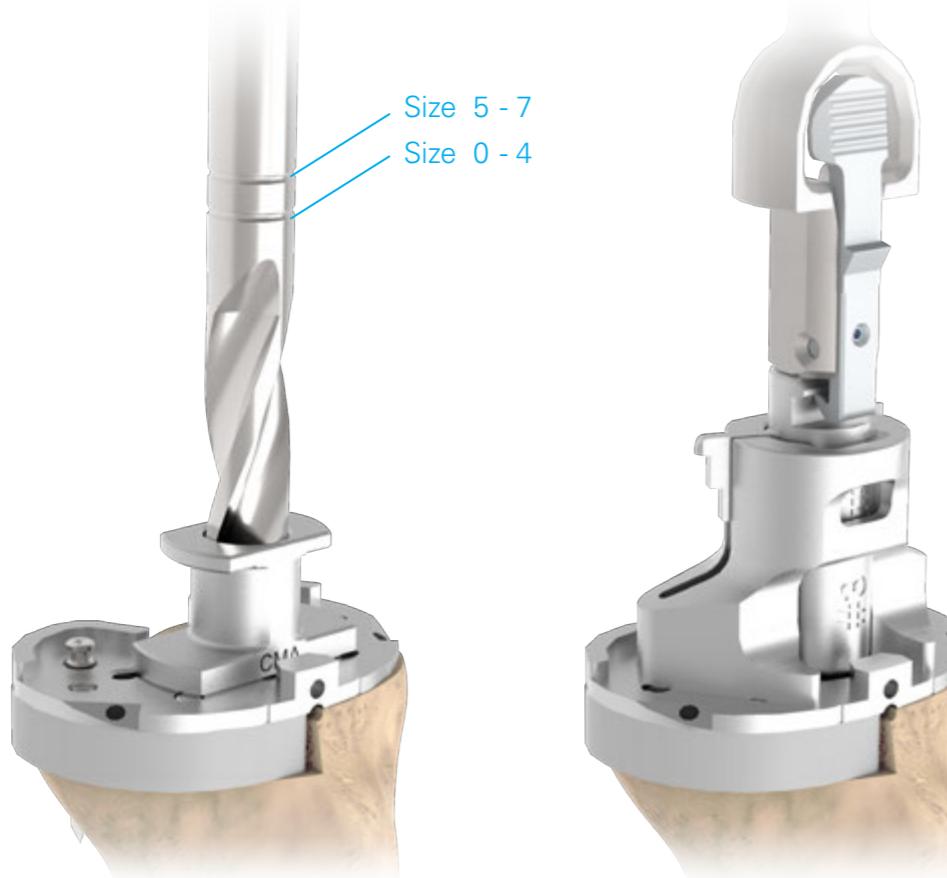

Then, attach the **Tibial Drill Guide, CMA** to the baseplate trial.

Appendix

To ensure the stability of tibial component, an extended 30 mm distal stem for the implant is recommended. Advance the **Straight Stem Drill** through the **Tibial Drill Guide, CMA** until the depth reaches the laser mark of the "0-4" or "5-7" line according to the selected size of the baseplate trial.

Remove the drill and drill guide. Resume Technique steps in Section I. Proximal Tibial Preparation and begin with selection of the correct **Tibial Punch**.

Instruments

Appendix

Assemble the **Screwdriver Adapter** to the **Driver Handle**, then fasten the determined augment onto the baseplate (For CMA baseplate).

Unscrew the plug at the bottom of the baseplate via **Screwdriver, Hex 5**. Solidly tap the stem onto the baseplate with the **Stem Impactor** to ensure the stem is firmly set.

Continue with the implant fixation.
