Thin layer chromatography

MACHEREY-NAGEL – TLC for more than 5 decades

MN ready-to-use layers for TLC and HPTLC

- Comprehensive range of plate sizes, surface chemistries and backings
- Pre-coated plates ready for immediate use
- Homogeneous, smooth and well adhering layers
- Available with UV indicator or non-impregnated
- Consistent high quality from batch-to-batch and from plate-to-plate

Reasons for using TLC

- Fast and cost-saving separation technique
- Multiple sample application possible
- Developed plate serves as analytical documentation media
- Time consuming sample preparation steps can be omitted

Benefits of TLC

TLC does not require complex or costly maintained instrumentation. The investment for performing successful TLC can be hundred times less than for HPLC. Since the separated compounds remain on the plate, they can be used for further experiments. Method development is simplified by TLC. The amount of solvents required for development is much less than with HPLC.

Thin layer chromatography

Standard analytical TLC plates and sheets

Thin layer chromatography can be used for both qualitative and quantitative analysis. Standard analytical TLC plates typically have adsorbent layers that are nominally between 0.20–0.25 mm in thickness.

Preparative TLC plates

Preparative TLC is used for purification and isolation of analytes from impurities. Preparative TLC layers (≥ 0.5 mm) are available on glass plates only.

Thin layer chromatography

In order to meet your individual application requirements three different types of backings are available.

TLC / HPTLC backings

TLC plates – glass backing

Glass plates are robust, heat proof and chemically resistant to all common mobile phases and visualization reagents.

POLYGRAM® TLC sheets – polyester backing

Polyester sheets are easy to handle, lightweight and flexible. Can be cut with scissors. Developed POLYGRAM® sheets can also be stored for documentation in laboratory notebooks.

ALUGRAM® TLC sheets – aluminum backing

Aluminum sheets are easy to handle, lightweight and flexible. High performance silica on ALUGRAM® Xtra sheets provides outstanding wettability for precise colorization results, even with 100 % aqueous detection reagents. Moreover ALUGRAM® Xtra sheets are easy to cut with scissors. No flaking of silica occurs!

Physical properties of backing materials

Material	glass	polyester	aluminum
Thickness (approx.)	1.3 mm	0.2 mm	0.15 mm
Weight, packing and storage requirement	high	low	low
Torsional strength	ideal	low	relatively high
Temperature stability	high	max. 185 °C	high
Susceptible to breakage	yes	no	no
Can be cut with scissors	no	yes	yes
Chemical resistance of support material			
Against solvents	high	high	high
Against mineral acids and conc. ammonia	high	high	low
Stability of the binder system of NP plates in water			
Suitability for aqueous detection reagents	depends on phase	good	ALUGRAM®: low to moderate ALUGRAM® Xtra: moderate to high

Thin layer chromatography

Most commonly used silica gel layers

SIL G

- Standard layer (soft)
- Available on glass plates, polyester and aluminum sheets
- Thicker layers for preparative TLC (PLC) on glass plates

ADAMANT

- Outstanding hardness and abrasion resistance
- Excellent separation efficiency
- Low-noise background of the layer
- Available on glass plates

SIL HD

- Hard layer with good abrasion resistance
- High luminosity
- Brilliant staining properties (e.g., with potassium permanganate - KMnO_4)
- Excellent separation efficiency
- Good wettability for precise colorization results – even with 100 % aqueous detection reagents
- Low-noise background of the layer
- Available on glass plates

Further layer materials

- Modified silica gel
- Cellulose
- Aluminum oxide
- Polyamide
- Special materials

Thin layer chromatography

Several layers on glass plates...

...for extended selectivity.

SIL G

smooth surface · easy to „scrape off“ · low polarity binder

ADAMANT

hardest surface · can be pen labeled

SIL HD

hard surface · excellent UV indicator system · brilliant staining properties

Plate size*	Plates per pack	SIL G**	REF	ADAMANT	REF	SIL HD	REF
TLC glass plates

* Further plate sizes available

** Also available as preparative TLC glass plates (PLC) with 0.50, 1.00 and 2.00 mm layer thickness

Thin layer chromatography

Nano TLC glass plates for HPTLC

Higher efficiency on smaller particles provide

- Sharper separations
- Shorter developing times and migration distances
- Smaller sample volumes 0.01–0.1 µL
- Minimal diffusion
- Increased detection sensitivity

Analytical HPTLC glass plates

- Silica 60, mean pore size 60 Å
- Specific pore volume 0.75 mL/g
- Thickness of layer 0.20 mm
- Mean particle size range 2–10 µm

Comparison of TLC and HPTLC glass plates for separation of anthraquinone dyes

Layers: A) TLC
B) HPTLC
Sample: 1 µL, about 0.1 %
Eluent: toluene – cyclohexane (4:3, v/v)
Migration time: A) 30 min, B) 15 min

- Peaks:
1. Blue 3
 2. Violet 2
 3. Red
 4. Green
 5. Blue 1
 6. Greenish blue
 7. Violet 1

* Further plate sizes available

** Contains fluorescent indicator

Thin layer chromatography

Polyester sheets for TLC

- Silica 60, mean pore size 60 Å
- Specific pore volume 0.75 mL/g
- Particle size 5–17 µm
- Standard grade
- The binder system for POLYGRAM® sheets is also completely stable in purely aqueous eluents

POLYGRAM® SIL G

Designation	Thickness of layer	Plate size*	Fluorescent indicator	Plates per pack	REF
SIL G	0.20 mm	2.5 x 7.5 cm	–	200	805902

* Further plate sizes available

Thin layer chromatography

Silica layers on aluminum sheets

ALUGRAM® Xtra SIL G (TLC) and ALUGRAM® Xtra Nano-SIL G (HPTLC)

- Silica 60, mean pore size 60 Å
- Specific pore volume 0.75 mL/g
- Particle size 5–17 µm (TLC), 2–10 µm (HPTLC)
- Outstanding wettability for precise colorization results, even with 100 % aqueous detection reagents
- Excellent separation efficiency and reproducibility from lot to lot
- Easy and reliable cutting due to an optimized binder system, no flaking of silica

Tailored for individual requirements

Designation	Thickness of layer	Plate size*	Fluorescent indicator	Plates per pack	REF

Thin layer chromatography

Preadsorbent zone

SILGUR and Nano-SILGUR with concentrating zone

After sample application in the kieselguhr layer the spots migrate to the kieselguhr/silica interface forming narrow bands. Separation then takes place in the silica layer.

- Concentrates sample spots on the plate
- Simplifies sample application

Channeled SILGUR plates

TLC plates with 19 channels help to prevent cross contamination by separating several samples. Spot areas can be determined more easily.
