OBTURA

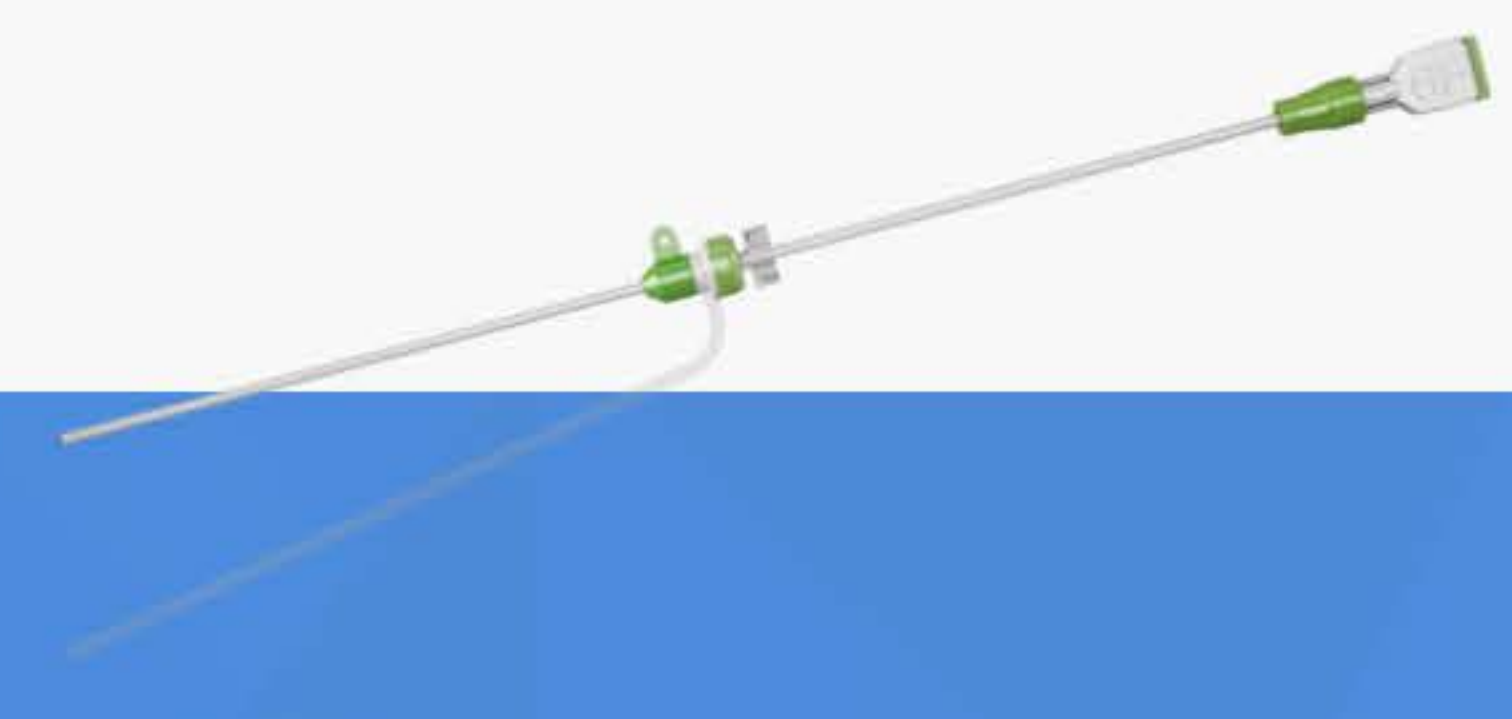

Obtura™ Vascular Closure Device is an effective mechanical system for femoral artery puncture site closure. Incorporated with a potent sealing system, it provides an assailable sealing with the collagen plug and efficiently designed anchor. Obtura™ Vascular Closure Device is a simple 3-Step closure device making it easy to use and yielding rapid hemostasis.

The Obtura™ VCD closes and sandwiches the arteriotomy between the anchor and collagen sponge. Hemostasis is achieved primarily by the mechanical means of the anchor - arteriotomy - collagen sandwich, which is supplemented by the coagulation inducing properties of the collagen.

The Obtura™ VCD can be used with the existing 6 and 8 French introducer sheath used during the interventional procedures with a working length of up to 12cm.

Benefits

- 01** No exchange of introducer sheath : Specially designed Obtura™ VCD is compatible with the standard existing introducer sheath used during the interventional procedures leading to reduced blood loss.
- 02** Less procedural time : With only 3 simple procedural steps Obtura™ saves time of the medical practitioner compared to manual compression.
- 03** Rapid Hemostasis : Efficient anchor secures with the puncture site leaving no space for blood loss and the collagen plug gives a foolproof hemostasis
- 04** 90 days absorption : Obtura™ facilitates patient friendly sealing with the implant deployed at the puncture site which is completely absorbed within 90 days.

Indication

The Obtura™ Vascular Closure Device is indicated for femoral artery puncture site closure, reducing times to hemostasis and ambulation in patients who have undergone diagnostic or interventional catheterization procedures using a standard 6F or 8F vascular sheath introducer with up to 12 cm working length.
