# 2 Introduction

# 2.1 Revision History

Version	Date	Author	Changes
1.0	2024-04-15	Tomas Burba	Document is prepared

# 2.2 Audience

This document is intended for the following:

- Potential users
- System integrators of medical equipment

It is assumed that the reader is familiar with the DICOM standard.

### 2.3 Remarks

DICOM, by itself, does not guarantee interoperability. However, the Conformance Statement facilitates a first level validation for interoperability between different applications supporting the same DICOM functionality.

This Conformance Statement is not intended to replace validation with other DICOM equipment to ensure proper exchange of information intended.

The scope of this Conformance Statement is to facilitate communication with other vendors' medical equipment. The Conformance Statement should be read and understood in conjunction with the DICOM Standard. However, by itself it is not guaranteed to ensure the desired interoperability and successful interconnectivity with existing DICOM systems.

The user should be aware of the following important issues:

- Test procedures should be defined to validate the desired level of connectivity.
- The DICOM standard will evolve to meet the users' future requirements.

# 2.4 Definitions and Terms

Informal definitions are provided for the following terms used in this Conformance Statement. The DICOM Standard is the authoritative source for formal definitions of these terms.

Table 1. Definitions and Terms

Term	Description		
Abstract Syntax	The information agreed to be exchanged between applications, generally equivalent to		
	a Service/Object Pair (SOP) Class.		
	Examples: Verification SOP Class, Modality Worklist Information Model Find SOP		
	Class, Ophthalmic Photography 8 Bit Image Storage SOP Class.		
Application	The specification of the type of communication used between Application Entities.		
Context	Example: DICOM network protocol.		
Application	An end point of a DICOM information exchange, including the DICOM network or		
Entity (AE)	media interface software; i.e., the software that sends or receives DICOM information		
	objects or messages.		
Application	The externally known name of an Application Entity, used to identify a DICOM		
Entity Title	application to other DICOM applications on the network.		
Association A network communication channel set up between Application Entities.			
Attribute	A unit of information in an object definition; a data element identified by a tag. The		
	information may be a complex data structure (Sequence), itself composed of lower		
	level data elements.		
	Examples: Patient ID (0010,0020), Accession Number (0008,0050), Photometric		
	Interpretation (0028,0004), Procedure Code Sequence (0008,1032).		

Information Object Definition (IOD)	The specified set of Attributes that comprise a type of data object; does not represent a specific instance of the data object, but rather a class of similar data objects that have the same properties. The Attributes may be specified as Mandatory (Type 1), Required
	but possibly unknown (Type 2), or Optional (Type 3), and there may be conditions
	associated with the use of an Attribute (Types 1C and 2C).
	Examples: MR Image IOD, CT Image IOD, Print Job IOD.
Module	A set of Attributes within an Information Object Definition that are logically related to
	each other.
	Example: Patient Module includes Patient Name, Patient ID, Patient Birth Date, and
NI C C	Patient Sex.
Negotiation	First phase of Association establishment that allows Application Entities to agree on
Draggatation	the types of data to be exchanged and how that data will be encoded.
Presentation	The set of DICOM network services used over an Association, as negotiated between
Context Protocol Data	Application Entities; includes Abstract Syntaxes and Transfer Syntaxes.  A packet (piece) of a DICOM message sent across the network. Devices must specify
Unit (PDU)	the maximum size packet they can receive for DICOM messages.
Query Key	A input value for a query process. Query Keys denote the set of DICOM tags that are
Query Ney	sent from the SCU to SCP and thus control the query result.
Service Class	Role of an Application Entity that provides a DICOM network service; typically, a server
Provider (SCP)	that performs operations requested by another Application Entity (Service Class User).
Trovidor (GGI)	Examples: Picture Archiving and Communication System (image storage SCP, and
	image query/retrieve SCP), Radiology Information System (modality worklist SCP).
Service Class	Role of an Application Entity that uses a DICOM network service; typically, a client.
User (SCU)	Examples: imaging modality (image storage SCU, and modality worklist SCU), imaging
,	workstation (image query/retrieve SCU)
Service/Object	The specification of the network or media transfer (service) of a particular type of data
Pair (SOP)	(object); the fundamental unit of DICOM interoperability specification.
Class	Examples: Ultrasound Image Storage Service, Basic Grayscale Print Management.
Service/Object	An information object; a specific occurrence of information exchanged in a SOP Class.
Pair (SOP)	Examples: a specific x-ray image.
Instance	
Tag	A 32-bit identifier for a data element, represented as a pair of four-digit hexadecimal
	numbers, the "group" and the "element". If the "group" number is odd, the tag is for a
	private (manufacturer-specific) data element.
	Examples: (0010,0020) [Patient ID], (07FE,0010) [Pixel Data], (0019,0210) [private
Transfer Ourter	data element]
Transfer Syntax	The encoding used for exchange of DICOM information objects and messages.
Unique Identifier	Examples: JPEG compressed (images), little endian explicit value representation.
Unique Identifier (UID)	A globally unique "dotted decimal" string that identifies a specific object or a class of objects; an ISO-8824 Object Identifier.
	Examples: Study Instance UID, SOP Class UID, SOP Instance UID.
Value	The format type of an individual DICOM data element, such as text, an integer, a
Representation	person's name, or a code. DICOM information objects can be transmitted with either
(VR)	explicit identification of the type of each data element (Explicit VR), or without explicit
` '	identification (Implicit VR); with Implicit VR, the receiving application must use a
	DICOM data dictionary to look up the format of each data element.

# 2.5 Abbreviations

The following acronyms are used in this document.

- AE Application Entity
- AET Application Entity Title
- DICOM Digital Imaging and Communication in Medicine
- DIMSE DICOM Message Service Element
- ILE Implicit VR Little Endian
- ISO International Standards Organization
- LUT Look-up Table
- MWL Modality Worklist

- NEMA National Electrical Manufacturers Association
- PDU Protocol Data Unit
- SCP Storage Class Provider
- SCU Storage Class User
- SOP Service Object Pair
- TCP/IP Transmission Control Protocol/Internet Protocol
- TLS Transport Layer Security
- UID Unique Identifier
- VR Value Representation

# 3 Networking

# 3.1 Implementation Model

# 3.1.1 Implementation Data Flow

Figure 1. Data Flow Diagram

#### 3.1.2 Functional Definition of AEs

#### 3.1.2.1 Functional Definition of DICOM Web User Agent Application Entity

The MedDream DICOM Web User Agent Application Entity communicates to an Origin Server over HTTP/1.1 and HTTPS/1.1 using the GET method. It sends requests to a RESTful web service (Studies Web Service) and to a URI service (URI Web Service).

There are multiple uses:

- 1) implements a back-end for the Search function where the operator is provided with a set of studies matching the query request;
- 2) obtains the study metadata as a Study Metadata resource (or Study's Instances resource with relevant &includefield query parameters for a reduced metadata set);
- 3) fetches the Composite SOP Instance either from URI Web Service as a DICOM Instance, or from Studies Web Service as an Instance resource if so configured;
- 4) stores marked Key Objects, or annotations based on Presentation State / Secondary Capture / RTSTRUCT, back to the Origin Server. This, however, is an optional scenario; configuration also allows the legacy scenario where those objects are still stored by the Storage Client AE via DIMSE.

#### 3.1.2.2 Functional Definition of Query/Retrieve Client Application Entity

The Query/Retrieve Client AE connects at the presentation address given as a Called Application Entity Title. It will propose Associations with Presentation Context for SOP Class of the Query/Retrieve Service Classes (study root FIND, study root MOVE).

When using the Client as a back-end for the Search function, the Query/Retrieve Client AE will wait on the same Association for a C-FIND response and then release the Association. The operator is provided with a set of studies matching the query request. Likewise with background use of the Client to obtain the study metadata.

When the Client is used to order retrieval of the entire study (or its part) to MedDream, it will wait for a C-FIND response, then send a C-MOVE command and upon reception of its response release the Association.

### 3.1.2.3 Functional Definition of Storage Client Application Entity

The MedDream Storage Client Application Entity is a STORAGE SCU. It connects to the presentation address configured as the Called Application Entity Title and establishes an Association with Presentation Context of

the Storage Service Class. Then it sends any supported DICOM Instances specified by the operator, over a Storage Request.

# 3.1.2.4 Functional Definition of Storage Server Application Entity

The MedDream Storage Server Application Entity waits for another application to connect at the presentation address configured for its Application Entity Title. When another application connects, the STORAGE SCP AE expects it to be a DICOM application.

The STORAGE SCP AE will accept Associations with Presentation Contexts for SOP Classes of the Verification, Instance Availability Notification and Storage Service Classes.

DICOM Instances received in a Storage Request are filed on the local (attached/mounted) file system. No any attributes from received Instances are stored anywhere except in file/directory names of the cache tree.

The received IAN N-CREATE messages are intended to control the in-advance processing and caching ("preparation") of DICOM Instances. If an Instance is referred together with Instance Availability attribute equal to "ONLINE", then a corresponding database job is created; upon its execution, a ready to use representation of the Instance is cached and will be presented faster to the end user. If an Instance is referred together with that attribute equal to "UNAVAILABLE", then references to it are removed from some kinds of cached data.

# 3.1.3 Sequencing of Real-World Activities

### 3.1.3.1 Universal mode: DICOM ("QR") - HIS integration

Figure 2. Universal mode: DICOM ("QR") - HIS integration

Table 2. Messages located in Universal mode: DICOM ("QR") - HIS integration

Message	Message	Condition	Documentation
no.			
1	chooseObject		
2	createTokenFromObjects	[optional]	
3	openObjectOrToken		The HIS presents URLs that point to MedDream and specify an object.

			Supported object types: Study UID, Patient ID, Accession Number, Accession Number + Patient ID.  If tokens are used, then a token value is passed instead. Afterwards the validator service returns "underlying" object identifiers.
4	validateTokenAndConvert ToObjects	[optional]	, ,
5	findStudies		Verifies presence: Study UID. Converts to Study UIDs: Accession Number, Accession Number + Patient ID, Patient ID.
6	cFindForStudies		
7	findStudy		Provides a hierarchical attribute tree (that represents a study structure) from study, series and image levels.
8	cFindForStudy		
9	getImageInputStream

Message	Message	Conditio	Documentation
no.		n	
1	chooseObject		
2	createTokenForObject	[optional]	
3	openObjectOrToken		The HIS presents URLs to MedDream that contain an object identifier. Supported identifier types: Study UID, Patient ID, Accession Number, Accession Number + Patient ID.  If tokens are used, then a token value is passed instead. Afterwards the token service returns
			"underlying" object identifiers.
4	validateTokenAndConve rtToObjects	[optional]	
5	findStudies		Verifies presence: Study UID.  Converts to Study UIDs: Accession Number, Patient ID, Accession Number + Patient ID.
6	qidoRsAllStudiesQuery		
7	findStudy		Provides a hierarchical attribute tree (that represents a study structure) from study, series and image levels.
8	wadoRsStudyMetadata Query		Can also be replaced by a QIDO-RS query that allows to specify what attributes are to be returned.
9	getlmageInputStream		. ,
10	wadoUriFetchDicomFile	[if not cached]	Can also use Retrievelnstance of WADO-RS.
11	saveAnnotations		
12	store		
13	stowRsQuery		

# 3.2 AE Specification

# 3.2.1 DICOM Web User Agent Application Entity Specification

This Application Entity implements:

- Retrieve DICOM Instance transaction (WADO-URI) with a URI Service as User Agent;
- Retrieve transaction (WADO-RS) with a Studies Service and Resources (for Study Metadata or Instance resources) as User Agent;
- Search transaction (QIDO-RS) with a Studies Service and Resources (for All Studies or Study's Instances resources) as User Agent;
- Store transaction (STOW-RS) with a Studies Service and Resources (for Studies or Study resources) as User Agent.

It does not implement any related Retrieve Capabilities Transaction.

#### 3.2.1.1 Retrieve DICOM Instance Transaction

#### 3.2.1.1.1 Description and Sequence of Activity

In the User Agent, WADO-URI is the simplest means to fetch a DICOM file and involves configuring the wadoUriUrl setting with a base URL and optional parameters. If the dicomFileUrl setting is used instead, then it must contain the entire URL with optional parameters to a WADO-URI endpoint of an Origin Server – because the flexibility of the underlying implementation also allows to set up Retrieve Instance of WADO-RS.

If the dicomCacheDirectory setting is not configured, the User Agent attempts to return a network-based data stream to MedDream; this might result in multiple downloads of the same resource over a short period of time. Otherwise, the received file is cached below this directory using a hierarchical path <Study UID>/<Series UID>/<SOP Instance UID>.dcm with UID values used during the request. Similarly, if such a file exists before the request, its contents are used instead. Out of date cached files are removed not by User Agent but by a different part of MedDream dedicated to cleaning.

### 3.2.1.1.2 Media Types

When the Agent is configured via the wadoUriUrl setting, the contentType query parameter is added automatically and is always "application/dicom".

When configured via the dicomFileUrl setting instead, then the entire URL template is provided and it should include "&contentType=application/dicom" for expected behavior of the Origin Server, if the latter doesn't provide this media type by default.

The HTTP Accept header is "application/dicom", too; however, if the googleCloudConfigFile setting is present, the header changes to "application/dicom; transfer-syntax=\*". A non-default value like "\*/\*" can be forced via the fileAcceptHeader setting.

MedDream expects a DICOM Part 10 file. It does its own rendering and cannot utilize any rendered media types from the Origin Server.

Figure 6. Place of the Retrieve DICOM Instance transaction in the workflow

#### 3.2.1.1.3 Query Parameter Usage

Table 6. Query Parameters during Retrieve DICOM Instance Transaction

Key	Value
requestType	Always "WADO"
studyUID	Study Instance UID
seriesUID	Series Instance UID
objectUID	SOP Instance UID
contentType	Always "application/dicom"

When the Agent is configured via the wadoUriUrl setting, the standard query parameters listed above are added automatically.

The setting wadoUriUrl can also include other parameters like transferSyntax or even non-standard parameters. They are inserted before the automatic ones, without checking for duplicates, therefore the Origin Server will likely ignore the first occurrence.

When configured via the dicomFileUrl setting instead, then the entire URL template is provided and it should include the query parameters listed above for expected behavior of the Origin Server. The template supports placeholders "{study}", "{series}" and "{image}" for dynamic values.

#### 3.2.1.1.4 Header Fields

The Accept header is always added, with the default value "application/dicom". The fileAcceptHeader setting can override it with something more neutral, like "\*/\*".

If the fileCustomHeader setting is not empty, then its value is added as is. The user must ensure the format "NAME: VALUE" and not attempt to override any permanently or dynamically present headers. Multiple values are to be separated by the pipe character ("|").

There is no Authorization header by default. Conditions for adding it are evaluated in the following order:

- 1) If the authType setting is "dcmsys", then the User Agent attempts a proprietary OAuth-based authentication. A POST request to loginUrl transfers a JSON-encoded object with fields "client\_id" (from the clientId setting), "client\_secret" (from the clientSecret setting), "grant\_type" (hardcoded value "password"), "username" (from the username setting), "password" (from the password setting). The field "access\_token" from the response is used in the Authorization: Bearer header in all subsequent requests to the Origin Server. When it expires according to the "expires\_in" response field, the authentication request is repeated automatically.
- 2) If the authType setting is "google" (legacy condition: the googleCloudConfigFile setting is configured), then the User Agent attempts a Google Cloud service account authentication. However, the subsequent WADO-URI is not supported by Google Cloud Healthcare; in such installations one must use the dicomFileUrl setting instead of wadoUriUrl.
- 3) If the authType setting is "azure" (legacy condition: the azureAuthUrl setting is configured and loginUrl is not), then the User Agent attempts the Azure cloud authentication. However, the subsequent WADO-URI is not supported by Azure DICOM Service; in such installations one must use the dicomFileUrl setting instead of wadoUriUrl.
- 4) If the authType setting is "custom" (legacy condition: the loginUrl setting is configured and azureAuthUrl is not), then a POST request to this address is sent, carrying HTML FORM parameters "login" from the username setting and "password" from the password setting, and expecting a cookie with name configured by the loginCookie setting. This cookie will be included in all subsequent requests to the Origin Server. When the cookie expires, the authentication request is repeated automatically.
- 5) If the authType setting is "basic" (legacy condition: only username and password settings are not empty), then they are encoded accordingly and added to the request as Authorization: Basic <encoded credentials>.
- 6) Otherwise (authType="none"), the Origin Server must accept anonymous connections.

# 3.2.1.1.5 Supported Information Objects

During the Retrieve DICOM Instance transaction, the User Agent is able to fetch and cache objects of any IOD, with any values of SOP Class and Transfer Syntax attributes; their Part 10 streams aren't parsed or otherwise verified during the network communication process. Support for IODs during later processing and rendering is beyond the scope of this chapter.

#### 3.2.1.2 Retrieve Transaction

#### 3.2.1.2.1 Description and Sequence of Activity

The User Agent uses the Retrieve transaction of WADO-RS for Study Metadata, which fetches attributes of all objects in the study at once. This is the initial part of study loading. It makes known the object UIDs for subsequent fetching of DICOM files, and prepares for different display of thumbnails according to object types detected by their other DICOM attributes.

This transaction can also be used for the Instance resource as an alternative to WADO-URI. Retrieval of entire series or study in a single transaction (Series Instances resource, Study Instances resource) is not supported.

During retrieval of the Instance resource, if the dicomCacheDirectory setting is not configured, the User Agent attempts to return a network-based data stream to MedDream; this might result in multiple downloads of the same resource over a short period of time. Otherwise, the received file is cached below this directory using a hierarchical path <Study UID>/<Series UID>/<SOP Instance UID>.dcm with UID values used during the request. Similarly, if such a file exists before the request, its contents are used instead. Out of date cached files are removed not by User Agent but by a different part of MedDream dedicated to cleaning.

#### 3.2.1.2.2 **Media Types**

For the Study Metadata resource, the default media type is "application/dicom+json" and the User Agent always expects a JSON stream (neither the Native DICOM Model from PS3.19, nor the encapsulation in a multipart container, are supported).

For the Instance resource, the default type is "application/dicom", or "application/dicom; transfer-syntax=\*" if the setting googleCloudConfigFile is configured. The response can be either single part or multipart; the latter is detected by Content-Type response header, and the first body is always taken (regardless of part headers).

The returned Instance resource must be a DICOM Part 10 file. MedDream does its own rendering and cannot utilize any rendered media types from the Origin Server.

Figure 7. Places of the Retrieve transactions in the workflow

#### 3.2.1.2.3 Query Parameter Usage

No query parameters are added automatically by the User Agent – neither for Study Metadata resource nor Instance resource.

The setting wadoRsUrl is a base URL that can include any query parameters (the remaining context path /studies/.../metadata is then automatically inserted, not appended). Its alternative, studyMetaUrl, is a full URL template with support for placeholders "{study}", "{series}" and "{image}" in the context path, and can contain query parameters, too. The customer decides whether the Origin Server requires any non-standard parameters.

If the dicomFileUrl setting specifies the full URL to a WADO-RS Instance resource (.../studies/{study}/series/{series}/instances/{image}), then a DICOM file is fetched via a Retrieve transaction, instead of the legacy Retrieve DICOM Instance of WADO-URI.

#### 3.2.1.2.4 Header Fields

The Accept header is always added, with values as per Media Types chapter above. The default value for Study Metadata resource can be overridden via the metaAcceptHeader setting. The default value for Instance resource can be configured via the fileAcceptHeader setting; for example, "multipart/related; type="application/dicom" would suggest the Origin Server to use a multipart container.

When retrieving the Study Metadata resource, if the metaCustomHeader setting is not empty, then its value is added as is; same with Instance resource and fileCustomHeader setting. The user must ensure the format "NAME: VALUE" and not attempt to override any permanently or dynamically present headers. Multiple values are to be separated by the pipe character ("|").

There is no Authorization header by default. Conditions for adding it are evaluated in the following order:

- 1) If the authType setting is "dcmsys", then the User Agent attempts a proprietary OAuth-based authentication. A POST request to loginUrl transfers a JSON-encoded object with fields "client\_id" (from the clientId setting), "client\_secret" (from the clientSecret setting), "grant\_type" (hardcoded value "password"), "username" (from the username setting), "password" (from the password setting). The field "access\_token" from the response is used in the Authorization: Bearer header in all subsequent requests to the Origin Server. When it expires according to "expires\_in" response field, the authentication request is repeated automatically.
- 2) If the authType setting is "google" (legacy condition: the googleCloudConfigFile setting is configured), then the User Agent performs a Google Cloud service account authentication via a third-party library "google-auth-library-oauth2-http". The obtained token is included in all subsequent requests to the Origin Server as Authorization: Bearer <token>.
- 3) If the authType setting is "azure" (legacy condition: the azureAuthUrl setting is configured and the loginUrl is not), then the User Agent performs the Azure cloud authentication. A GET (not POST) request is sent to azureAuthUrl, carrying HTML FORM parameters in the Body: "client\_id" from the username setting, "client\_secret" from the password setting, hardcoded values of "grant\_type" and "resource". A JSON response is expected with fields "token\_type" (equal to "Bearer"), "expires\_in" and "access\_token". The latter will be included in all subsequent requests to the Origin Server in form of Authorization: Bearer <token>. When the token expires, the authentication request is repeated automatically.
- 4) If the authType setting is "custom" (legacy condition: the loginUrl setting is configured and azureAuthUrl is not), then a POST request to this address is sent, carrying HTML FORM parameters "login" from the username setting and "password" from the password setting, and expecting a cookie with name configured by the loginCookie setting. This cookie will be included in all subsequent requests to the Origin Server. When the cookie expires, the authentication request is repeated automatically.
- 5) If the authType setting is "basic" (legacy condition: only username and password settings are not empty), then they are encoded accordingly and added to the request as Authorization: Basic <encoded credentials>.
- 6) Otherwise (authType="none"), the Origin Server must accept anonymous connections.

#### 3.2.1.2.5 Response Payload Attribute Usage

The following fields are expected in the Study Metadata resource:

- (0008,0020) Study Date
- (0008,0030) Study Time
- (0010,0010) Patient Name
- (0010,0020) Patient ID
- (0010,0030) Patient Birth Date
- (0008,0050) Accession Number
- (0008,0060) Modality
- (0008,1030) Study Description
- (0020,0010) Study ID
- (0008,0090) Referring Physician's Name
- (0020,000E) Series Instance UID
- (0008,103E) Series Description
- (0020,0011) Series Number
- (0008,0018) SOP Instance UID
- (0002,0010) Transfer Syntax UID

- (0008,0016) SOP Class UID
- (0028,0008) Number Of Frames
- (0020,0013) Instance Number
- a tag configured via columns.sourceAE.tag setting (none by default)

Their absence will have consequences ranging from minor to fatal; a degree of importance of particular tags is not specified at the moment. Particularly, Series Instance UID and SOP Instance UID are crucial for subsequent fetching of a DICOM file.

### 3.2.1.2.6 Supported Information Objects

If configured to use WADO-RS Retrieve Instance for fetching of DICOM files, the User Agent is able to fetch and cache objects of any IOD, with any values of SOP Class and Transfer Syntax attributes; their Part 10 streams aren't parsed or otherwise verified during the network communication process. Support for IODs during later processing and rendering is beyond the scope of this chapter.

#### 3.2.1.3 Search Transaction

# 3.2.1.3.1 Description and Sequence of Activity

During an interactive login session, the Search transaction (resulting in an All Studies resource) precedes any others and allows the end user to choose the study for viewing.

Figure 8. Places of the Search transactions in the workflow

Multiple transactions will be executed if the configuration parameter searchPageSize is less than 1000, as MedDream still attempts to collect 1000 results using smaller queries.

During a HIS integration session, the Search transaction resolves an object identifier like Accession Number or Patient ID to a list of Study Instance UID values. When the identifier is already a Study Instance UID in case of the "insecure" URL integration, then the transaction at least verifies presence of the object and is important for protection against unauthorized access.

Due to a flexible implementation, the Search transaction can also be used for fetching study metadata as Study's Instances resource of QIDO-RS (an alternative to Study Metadata of WADO-RS), as this provides a chance to improve performance by requesting only relevant DICOM Attributes.

### 3.2.1.3.2 **Media Types**

The default media type is "application/dicom+json" and can be modified via the metaAcceptHeader setting. The User Agent always expects a JSON stream; neither the Native DICOM Model from PS3.19 nor the encapsulation in a multipart container are supported.

#### 3.2.1.3.3 Query Parameter Usage

Table 7. Query Parameters during Search Transaction

Key	Value
limit	Equal to the setting searchPageSize. The default is "200" if Azure authentication is
	configured, and "1000" otherwise.
offset	If the setting searchPageSize is less than 1000, then multiple requests are made with value of "offset" parameter increasing accordingly, until the response contains less than searchPageSize results or 1000 results in total are collected. Otherwise this parameter is not sent.
includefield	Multiple occurrences with possible values of 0020000D, 00080020, 00080030, 00100010, 00100020, 00100030, 00080050, 00080061, 00081030, 00200010, 00080090. Can also include hexadecimal values of settings columns.sourceAE.tag and columns.receivedDate.tag if those are configured.
00100020	When a Patient Name filter is entered in the Search window: its value, automatically surrounded by "*" characters.
00100010	When a Patient ID filter is entered in the Search window: its value, automatically surrounded by "*" characters.
	When the viewer is being opened from HIS with a Patient ID filter: the exact value of the filter.
	The strictSearchIsEnabled setting can force presence/absence of "*" characters in both cases.
00080061	Value of the Modality filter is in the Search window. By default, the "*" characters are not present (exact match). If the otherStrictSearchTags setting is modified and does not contain the number 524384, then the filter value is surrounded by "*" (substring match).
00080020	When a Study Date filter is entered in the Search window: a two-sided or one-sided date range (depending on whether both date fields are present), delimited by a hyphen character. Format: FROM-TO, FROM-, -TO.
00081030	When a Study Description filter is entered in the Search window: its value, automatically surrounded by "*" characters.
00080050	When an Accession Number filter is entered in the Search window: its value, automatically surrounded by "*" characters.
	When the viewer is being opened from HIS with an Accession Number filter: the exact value of the filter.
	The strictSearchIsEnabled setting can force presence/absence of "*" characters in both cases.
0020000D	When the viewer is opened from HIS with a Study UID filter: the exact value of the filter.
(hexadecima I value of setting col- umns.source AE.tag)	When columns.sourceAE.tag is configured, and a Source AE Title filter is entered in the Search window: value of the filter, automatically surrounded by "*" characters. The "*" characters are not added if otherStrictSearchTags setting is modified and contains the same value as in sourceAeTitleTag.

The query parameters listed above are added automatically when fetching an All Studies resource.

The qidoRsUrl setting is a base URL that can also include other standard parameters like fuzzymatching, or even non-standard parameters. They are inserted before the automatic ones, without checking for duplicates, therefore the Origin Server will likely ignore the first occurrence.

If the wadoRsUrl setting remains unconfigured and the studyMetaUrl setting is used instead, then the source of study metadata is not necessarily Study Metadata resource of WADO-RS; it can also be Study's Instances resource of QIDO-RS. As studyMetaUrl is a full URL template that supports the "{study}" placeholder, in this

case it should contain a typical value for Study's Instances, like .../studies/{study}/instances?inc-ludefield=00080020&... No query parameters are added automatically to studyMetaUrl, the customer is responsible for the entire URL. For the minimum set of includefield values, see Response Payload Attribute Usage under Retrieve Transaction.

#### 3.2.1.3.4 Header Fields

The Accept header is always added, with value of "application/dicom+json" (can be overridden via the metaAcceptHeader setting).

If the metaCustomHeader setting is not empty, then its value is added as is. The user must ensure the format "NAME: VALUE" and not attempt to override any permanently or dynamically present headers. Multiple values are to be separated by the pipe character ("|").

There is no Authorization header by default. Conditions for adding it are evaluated in the following order:

- 1) If the authType setting is "dcmsys", then the User Agent attempts a proprietary OAuth-based authentication. A POST request to loginUrl transfers a JSON-encoded object with fields "client\_id" (from the clientId setting), "client\_secret" (from the clientSecret setting), "grant\_type" (hardcoded value "password"), "username" (from the username setting), "password" (from the password setting). The field "access\_token" from the response is used in the Authorization: Bearer header in all subsequent requests to the Origin Server. When it expires according to "expires\_in" field, the authentication request is repeated automatically.
- 2) If the authType setting is "google" (legacy condition: the googleCloudConfigFile setting is configured), then the User Agent performs a Google Cloud service account authentication via a third-party library "google-auth-library-oauth2-http". The obtained token is included in all subsequent requests to the Origin Server as Authorization: Bearer <token>.
- 3) If the authType setting is "azure" (legacy condition: the azureAuthUrl setting is configured and loginUrl is not), then the User Agent performs the Azure cloud authentication. A GET (not POST) request is sent to azureAuthUrl, carrying HTML FORM parameters in the Body: "client\_id" from the username setting, "client\_secret" from the password setting, hardcoded values of "grant\_type" and "resource". A JSON response is expected with fields "token\_type" (must be equal to "Bearer"), "expires\_in" and "access\_token". The latter will be included in all subsequent requests to the Origin Server in form of Authorization: Bearer <token>. When the token expires, the authentication request is repeated automatically.
- 4) If the authType setting is "custom" (legacy condition: the loginUrl setting is configured and azureAuthUrl is not), then a POST request to this address is sent, carrying HTML FORM parameters "login" from the username setting and "password" from the password setting, and expecting a cookie with name configured by the loginCookie setting. This cookie will be included in all subsequent requests to the Origin Server. When the cookie expires, the authentication request is repeated automatically.
- 5) If the authType setting is "basic" (legacy condition: only username and password settings are not empty), then they are encoded accordingly and added to the request as Authorization: Basic <encoded credentials>.
- 6) Otherwise (authType="none"), the Origin Server must accept anonymous connections.

#### 3.2.1.3.5 Response Payload Attribute Usage

The following fields are expected in the All Studies resource:

- (0020,000D) Study Instance UID
- (0008,0020) Study Date
- (0008,0030) Study Time
- (0010,0010) Patient Name
- (0010,0020) Patient ID
- (0010,0030) Patient Birth Date
- (0008.0050) Accession Number
- (0008,0061) Modalities In Study
- (0008,1030) Study Description
- (0020,0010) Study ID
- (0008,0090) Referring Physician's Name
- a tag configured via columns.sourceAE.tag setting (none by default)
- a tag configured via columns.receivedDate.tag setting (none by default)

Their absence might result in undefined behavior; a degree of importance of particular DICOM Attributes is not specified at the moment. At least Study Instance UID is needed for subsequent opening of the study.

For a list of fields expected in the Study's Instances resource, see Response Payload Attribute Usage under Retrieve Transaction.

#### 3.2.1.4 Store Transaction

# 3.2.1.4.1 Description and Sequence of Activity

The User Agent uses the Store transaction of STOW-RS for uploading new objects (DICOM-formatted annotations) back to the Origin Server. It sends a single instance in DICOM Part 10 format.

Figure 9. Places of the Store transactions in the workfllow

#### 3.2.1.4.2 Query Parameter Usage

No query parameters are added automatically by the User Agent.

A substring "/studies/{study}" is automatically added to the value of stowRsUrl and later the {study} placeholder is replaced with Study Instance UID extracted from the object being uploaded. This kind of URL instructs the Origin Server to validate the Study Instance UID attribute in the object being uploaded, although there is no benefit in doing so. In contrast, the alternative setting uploadUrl is a template for a ready to use URL; if that validation is needed due to requirements of the Origin Server, then uploadUrl must also contain the substring "/studies/{study}", and vice versa.

#### 3.2.1.4.3 Header Fields

The Accept header is always added. The default value is "application/dicom+json" and can be overridden via the sendAcceptHeader setting.

If the sendCustomHeader setting is not empty, then its value is added as is. The user must ensure the format "NAME: VALUE" and do not attempt to override any permanently or dynamically present headers. Multiple values are to be separated by the pipe character ("|").

There is no Authorization header by default. Conditions for adding it are evaluated in the following order:

- 1) If the authType setting is "dcmsys", then the User Agent attempts a proprietary OAuth-based authentication. A POST request to loginUrl transfers a JSON-encoded object with fields "client\_id" (from the clientId setting), "client\_secret" (from the clientSecret setting), "grant\_type" (hardcoded value "password"), "username" (from the username setting), "password" (from the password setting). The field "access\_token" from the response is used in the Authorization: Bearer header in all subsequent requests to the Origin Server. When it expires according to "expires\_in" field, the authentication request is repeated automatically.
- 2) If the authType setting is "google" (legacy condition: the googleCloudConfigFile setting is configured), then the User Agent performs a Google Cloud service account authentication via a third-party library "google-auth-library-oauth2-http". The obtained token is included in all subsequent requests to the Origin Server as Authorization: Bearer <token>.
- 3) If the authType setting is "azure" (legacy condition: the azureAuthUrl setting is configured and loginUrl is not), then the User Agent performs the Azure cloud authentication. A GET (not POST) request is sent to azureAuthUrl, carrying HTML FORM parameters in the Body: "client\_id" from the username setting, "client\_secret" from the password setting, hardcoded values of "grant\_type" and "resource". A JSON response is expected with fields "token\_type" (equal to "Bearer"), "expires\_in" and "access\_token". The latter will be included in all subsequent requests to the Origin Server in form of Authorization: Bearer <token>. When the token expires, the authentication request is repeated automatically.
- 4) If the authType setting is "custom" (legacy condition: the loginUrl setting is configured and azureAuthUrl is not), then a POST request to this address is sent, carrying HTML FORM parameters "login" from the username setting and "password" from the password setting, and expecting a cookie with name configured by the loginCookie setting. This cookie will be included in all subsequent requests to the Origin Server. When the cookie expires, the authentication request is repeated automatically.
- 5) If the authType setting is "basic" (legacy condition: only username and password settings are not empty), then they are encoded accordingly and added to the request as Authorization: Basic <encoded credentials>.
- 6) Otherwise (authType="none"), the Origin Server must accept anonymous connections.

### 3.2.1.4.4 Response Payload Attribute Usage

An HTTP Status code 200 or 204 is treated as a success indicator. Additionally, a non-empty Body must contain a valid JSON stream with a PS 3.19-formatted object structure. If it's (0008,1199) Referenced SOP Sequence > (0008,1196) Warning Reason, then the first element of the latter is logged for reference (not displayed to the end user).

# 3.2.2 Query/Retrieve Client Application Entity Specification

# 3.2.2.1 SOP Classes

Application Entity provides Standard Conformance to the following SOP Classes:

Table 8. SOP Classes for Query/Retrieve Client AE

SOP Class Name	SOP Class UID	SCU	SCP
Study Root Query/Retrieve Information Model – FIND	1.2.840.10008.5.1.4.1.2.2.1	YES	NO
Study Root Query/Retrieve Information Model – MOVE	1.2.840.10008.5.1.4.1.2.2.2	YES	NO

#### 3.2.2.2 Associations Policies

#### 3.2.2.2.1 General

At a command from the operator, the MedDream Query/Retrieve Client AE attempts to establish an association with the specified Remote AE. When the association is established, a C-FIND request is made to retrieve a list of studies using the defined matching keys, or metadata of a study using its Study Instance UID. In the second case, after the response confirms existence of the study, an additional C-MOVE sub-request might be made to order the transfer of the entire study, or a part of it missing in the on-disk cache, to the MedDream Storage Server AE. The MedDream Query/Retrieve Client waits for any C-FIND response. The established

association remains active until a C-FIND response from the remote AE indicates the end of requested data items, or until a timeout period expires.

The MedDream Query/Retrieve Client AE itself does not accept Associations.

The DICOM standard application context name for DICOM 3.0 is always accepted and proposed:

Table 9. DICOM application context name for Query/Retrieve Client AE

Application Context Name	1.2.840.10008.3.1.1.1
--------------------------	-----------------------

#### 3.2.2.2.2 Number of Associations

There is no specific limit on number of parallel C-FIND associations. They are indirectly influenced by the limit on concurrent connections in the commercial license of MedDream. The results of a C-FIND request are displayed to the operator only after receiving them from SCP entirely.

The number of parallel C-MOVE associations can be partially controlled by the setting maxConnections (no limit by default). This limit is separately imposed on every configured storage, which is usually dedicated to a separate Remote AE.

#### 3.2.2.2.3 Asynchronous Nature

The Query/Retrieve Client does not support asynchronous communication (multiple outstanding transactions over a single Association).

#### 3.2.2.2.4 Implementation Identifying Information

When searching for studies interactively, or ordering a C-MOVE operation for study retrieval, the implementation information for this Application Entity is:

Table 10. DICOM Implementation Class and Version for Query/Retrieve Client AE

Implementation Class UID	1.2.826.0.1.3680043.2.60.0.1
Implementation Version Name	jdt280_6553

When fetching attributes of a study ("study structure"), a different network client is used:

Table 11. DICOM Implementation Class and Version for Query/Retrieve Client AE (study attributes scenario)

Implementation Class UID	1.2.40.0.13.1.1
Implementation Version Name	dcm4che-2.0

#### 3.2.2.3 Association Initiation Policy

### 3.2.2.3.1 Activity - All interactions

#### 3.2.2.3.1.1 Description and Sequence of Activity

Table 12. Query/Retrieve Client Supported Elements

Tag and Attribute Name	VR	Query key	Modifiable	Displayed in GUI
(0008,0020) Study Date	DA	Х	Х	Х
(0008,0030) Study Time	TM	_	_	X
(0008,0050) Accession Number	SH	С	Х	X
(0008,0052) Query/Retrieve Level	CS	Х	_	_
(0008,0061) Modalities In Study	CS	Х	Х	X
(0008,1030) Study Description	LO	Р	Х	_
(0010,0010) Patient's Name	PN	Р	X	X
(0010,0020) Patient ID	LO	С	Х	X
(0020,000D) Study Instance UID	UI	Х	_	_

The attributes listed above can be requested in a query. The corresponding matching keys are empty if the operator didn't specify a particular value; it's not possible to search for an empty value.

Legend:

- X = Always an exact match.
- P = Always a partial match (value is automatically enclosed by "\*" characters).
- C = Partial match (automatically enclosed by "\*" characters) when searching interactively, or exact match when used as a study identifier in HIS integration scenarios.

Figure 10. All interactions

Table 13. Proposed Presentation Contexts for Query/Retrieve Client AE

Abstract Sy	Transfer Syn	Role	Ext.

### 3.2.3.2 Associations Policies

# 3.2.3.2.1 General

The Storage Client AE proposes Association Requests for the Storage Service.

The DICOM standard application context name for DICOM 3.0 is always accepted and proposed:

	Table	17. DICOM application context name for Storage Client AE
Application Context Name		1.2.840.10008.3.1.1.1

# 3.2.3.2.2 Number of Associations

The number of parallel associations is controlled by the setting com.softneta.meddream.dcmsnd.dicomSend-ThreadCount, and is 1 by default.

For every object sent, a separate Association is made.

# 3.2.3.2.3 Asynchronous Nature

The Storage Client does not support asynchronous communication (multiple outstanding transactions over a single Association).

# 3.2.3.2.4 Implementation Identifying Information

When the annotations (PR, KO, SC, RTSTRUCT) are saved via the common QR-based mechanism, or a study is forwarded under configuration forwardingMethod=native, then the implementation information for this Application Entity is:

Table 18. DICOM Implementation Class and Version for Storage Client AE (configuration 1)

	Table Tel Election implem	ondation ended and vereign electing enemy in (comparation i)
Implementation Class UID		1.3.6.1.4.1.44316.0.1.2
Implementation Version Name		MEDDREAM840

When the annotations are saved via the "QR" plugin (storage configuration includes storageApiEnabled=true), or a study is forwarded under configuration forwardingMethod=cmove, then the implementation information for this Application Entity is:

Table 19. DICOM Implementation Class and Version for Storage Client AE (configuration 2)

Implementation Class UID	1.2.826.0.1.3680043.2.60.0.1
Implementation Version Name	jdt280_6558

Forwarding of a study under configuration forwardingMethod=plugin uses a third-party Storage Client (not bundled with MedDream) which behavior will depend on its version installed at a particular infrastructure. See the conformance statement for the specific version of PacsOne Server.

# 3.2.3.3 Association Initiation Policy

#### 3.2.3.3.1 Activity - All interactions

# 3.2.3.3.1.1 Description and Sequence of Activity

# 3.2.3.3.1.3 SOP Specific Conformance for SOP Classes

Table 21. Storage Client Response Status Handling Behavior

Service	Further	Error	Behavior
Status	Meaning	Code	
Success	Success	0000	The Composite SOP Instance was successfully received and stored
			in the system repository by the SCP. Proceed to next step.
Warning	Data Element	B000	The SCP has corrected some Data Element(s) to avoid a conflict.
	Coercion		Warning indication message is output to the logs. Assume that the
			Instance has been stored successfully and proceed to next step.
Warning	Elements	B006	Some Data Element(s) were discarded by the SCP. Warning
	Discarded		indication message is output to the logs. Assume that the Instance
			has been stored successfully and proceed to next step
Warning	Data Set does	B007	Assume that the SCP has stored the Instance anyway. Warning
	not match		indication message is output to the logs. Proceed to next step.
	SOP Class		
Error	Others	Others	Any unrecognized Error Code is considered an indication that the
			Instance wasn't stored. Error indication message is output to the
			logs. Do not include the Instance in the number of transferred
			Instances and their summary size but still proceed to the next step.

Table 22. Storage Client Communication Failure Behavior

Exception	Behavior
Association aborted by the SCP or the network layers indicate	Error message is output to the
communication loss (i.e., low-level TCP/IP socket closure)	application logs.

# 3.2.4 Storage Server Application Entity Specification

# 3.2.4.1 SOP Classes

Application Entity provides Standard Conformance to the following SOP Classes:

Table 23. SOP Classes for Storage Server AE

## 3.2.4.2 Associations Policies

#### 3.2.4.2.1 General

The Storage Server AE accepts Association Requests for the Storage Service, Verification Service and Instance Availability Notification Service.

The DICOM standard application context name for DICOM 3.0 is always accepted and proposed:

Table 24. DICOM application context name for Storage Serve		
Application Context Name	1.2.840.10008.3.1.1.1	

### 3.2.4.2.2 Number of Associations

The number of supported parallel associations can be adjusted, and is 5 by default. This is a socket-level limitation; any more attempts (up to 50 in parallel) to connect to the service port will wait indefinitely.

# 3.2.4.2.3 Asynchronous Nature

The Storage Server does not support asynchronous communication (multiple outstanding transactions over a single Association).

### 3.2.4.2.4 Implementation Identifying Information

The implementation information for this Application Entity is:

Table 25. DICOM Implementation Class and Version for Storage Server AE

	,	0
Implementation Class UID	1.3.6.1.4.1.44316.0.1.2	
Implementation Version Name	MEDDREAM840	

#### 3.2.4.3 Association Initiation Policy

# 3.2.4.3.1 Activity - All interactions

3.2.4.3.1.1 Description and Sequence of Activity

If configured, the Storage Server is always running in background, regardless of user's actions.

It replies to Verification requests at any time.

It always listens for Storage requests. If a supported Presentation Context is offered, the corresponding Composite Object is stored below the cache directory. This can be a result of either a C-MOVE request from the Query/Retrieve Client in MedDream (which shortly afterwards finds the stored object in the cache), or a standalone decision from the SCP to forward the object to MedDream in advance (and therefore the C-MOVE request can be avoided).

It always listens for Instance Availability Notification requests.

Figure 12. All interactions

# 3.2.4.3.1.3 SOP Specific Conformance for SOP Classes

Table 27. Storage Server Response Status Handling Behavior

Service	Further Meaning	Error	Behavior
Status		Code	
Success	Success	0000	The Composite SOP Instance was successfully received,
			verified, and stored in the system repository.
Error	Processing	0110	Some internal error prevented creation of a background job from
	Failure		an Instance Availability Notification message. The appropriate
			Status will be sent in the N-CREATE Response. Error indication
			message is output to the application log.
Error	Missing Attribute	0120	The Instance Availability Notification message doesn't contain a
			mandatory DICOM attribute. The appropriate Status will be sent
			in the N-CREATE Response. Error indication message is output
			to the application log.
Error	Missing Attribute	0121	Some DICOM attribute in the Instance Availability Notification
	Value		message is empty. The appropriate Status will be sent in the N-
			CREATE Response. Error indication message is output to the
			application log.
Error	Out of Resources	A700	This status is returned due to internal errors such as a
			processing failure response from a file system operation. The
			appropriate Status will be sent in the C-STORE Response. Error
			indication message is output to the application log.

Table 28. Storage Server Communication Failure Behavior

Exception	Behavior
Association aborted by the SCU or the network layers indicate	Error message is output to the
communication loss (i.e., low-level TCP/IP socket closure)	application logs.

# 3.3 Network Interfaces

DICOM Upper Layer over TCP/IP is supported by:

- Query/Retrieve Client
- Storage Client
- Storage Server

HTTP and HTTPS are supported by:

• DICOM Web User Agent

# 3.3.1 Physical Network Interface

MedDream is indifferent to the physical medium over which TCP/IP executes. It inherits the TCP/IP stack from the operating system.

## 3.3.2 Additional Protocols

No additional protocols are supported.

# 3.3.3 IPv4 and IPv6 Support

Only IPv4 is explicitly supported and was tested.

# 3.4 Configuration

# 3.4.1 AE Title/Presentation Address Mapping

## 3.4.1.1 Local AE Titles

Application Entity	Default AE Title	Default TCP/IP Port
Query/Retrieve Client	MEDDREAM	not applicable
Storage Client	MEDDREAM	not applicable
Storage Server	MEDDREAM	11116

## 3.4.1.2 Remote AE Title

The remote AE Titles and TCP ports are configurable in application settings.

# 3.4.2 Parameters

MedDream configuration parameters relevant to DICOM communication are as follows.

Table 29. Configuration Parameter Table

		ble 29. Configuration Parameter Table
Parameter	Configurable (Yes/No)	Default Value
DICOM Web User Ag	ent AE	
searchPageSize: override the "limit" query parameter	Yes	1000 (or 200 if Azure authentication is configured)
strictSearchIsEnabled: use of wildcards in query keys 00100010 (Patient ID) and 00080050 (Accession Number)	Yes	No value = wildcards are added when searching interactively, and not added when opening an object via HIS integration.
otherStrictSearchTags: usage of wildcards for Modality and source AE title	Yes	524384 = wildcards are not added to Modality and are added to source AE title
multivalueSeparatorIsComma: multiple values of the Modalities In Study search key are separated by commas	Yes	false = multiple values are separated by backslashes
fileAcceptHeader: value of Accept header during Retrieve transaction for Instance resource and during Retrieve DICOM Instance transaction	Yes	application/json
metaAcceptHeader: value of Accept header during Retrieve transaction for Study Metadata resource and during Search transaction	Yes	application/dicom
sendAcceptHeader: value of Accept header during Store transaction	Yes	application/json
metaCustomHeader: value of a custom header during Retrieve transaction for Instance resource and during Retrieve DICOM Instance transaction	Yes	no default value
fileCustomHeader: value of a custom header during Retrieve transaction for Study Metadata resource and during Search transaction	Yes	no default value
sendCustomHeader: value of a custom header during Store transaction	Yes	no default value
columns.sourceAE.tag: tag of DICOM Attribute supported by server as Source AE Title of the study	Yes	no default value
columns.receivedDate.tag: tag of DICOM Attribute supported by server as receive date of the study	Yes	no default value
Query/Retrieve Clie	nt AE	
Bind to port	No	none
Proposed Calling AET	Yes	MEDDREAM
Proposed Called AET	Yes	administrator's choice
Maximum PDU size the AE can receive	No	32768

Maximum PDU size the AE can send	Yes	32768
Support for the Basic TLS Secure Transport Connection Profile Accepted TLS Ciphers	No No	unsupported

Note 1: applies only to searching for studies and sending a C-MOVE command. When Query/Retrieve Client is used for collecting attributes of a study, then the default timeout value is 5 seconds and configurable.

# 4 Processing and rendering

# 4.1 SOP Classes supported for display

Known unsupported non-image Classes, like Raw Data Storage (1.2.840.10008.5.1.4.1.1.66), are used by a hardcoded filter that removes those objects from the study. Export and Forward functionalities, however, will still transfer them.

At least one example of a DICOM object referenced in the table below is used in regular tests of MedDream.

Table 30. SOP Classes supported for disp

# 4.2 Transfer Syntaxes supported for display

When parsing the DICOM files for display purposes, MedDream expects DICOM Part 10 files — namely, with Preamble, Prefix and FileMetaInformation. If those pieces are missing, then only Implicit VR Little Endian transfer syntax is supported.

The Deflated Explicit VR Little Endian (1.2.840.10008.1.2.1.99) transfer syntax is not supported neither for visualization nor for network operations.

At least one example of a DICOM object referenced in the table below is used in regular tests of MedDream.

Table 31. Transfer Syntaxes supported for display

Transfer Syntax Name	Transfer Syntax UID
Explicit VR Big Endian	1.2.840.10008.1.2.2
Explicit VR Little Endian	1.2.840.10008.1.2.1
Implicit VR Little Endian: Default Transfer Syntax for DICOM	1.2.840.10008.1.2
JPEG 2000 Image Compression	1.2.840.10008.1.2.4.91
JPEG 2000 Image Compression (Lossless Only)	1.2.840.10008.1.2.4.90
JPEG Baseline (Process 1): Default Transfer Syntax for Lossy JPEG 8 Bit	1.2.840.10008.1.2.4.50
Image Compression	
JPEG Extended (Process 2 & 4): Default Transfer Syntax for Lossy JPEG 12	1.2.840.10008.1.2.4.51
Bit Image Compression (Process 4 only)	
JPEG Lossless, Non-Hierarchical, First-Order Prediction (Process 14	1.2.840.10008.1.2.4.70
[Selection Value 1]): Default Transfer Syntax for Lossless JPEG Image	
Compression	
JPEG Lossless, Nonhierarchical (Processes 14)	1.2.840.10008.1.2.4.57
JPEG-LS Lossless Image Compression	1.2.840.10008.1.2.4.80
JPEG-LS Lossy (Near- Lossless) Image Compression	1.2.840.10008.1.2.4.81
MPEG2 Main Profile @ High Level	1.2.840.10008.1.2.4.101

MPEG2 Main Profile @ Main Level	1.2.840.10008.1.2.4.100
MPEG-4 AVC/H.264 BD-compatible High Profile / Level 4.1	1.2.840.10008.1.2.4.103
MPEG-4 AVC/H.264 High Profile / Level 4.1	1.2.840.10008.1.2.4.102
RLE Lossless	1.2.840.10008.1.2.5

# 4.3 Other related notes

The setting com.softneta.dicom-parser.builtInOverlayEnabled disables overlay graphics in scenarios where images are traditionally rendered without user interaction, like display of image thumbnails or export of images into PNG format. During interactive image viewing, rendering of both legacy (single per image) and standard (up to 16 per image) overlay formats are controllable by the user.

For raster objects, unsupported values of Bits Allocated (0028,0100) are:

- larger than 16 when Samples per Pixel (0028,0002) is 1,
- larger than 8 when Samples Per Pixel is 3.

# 5 Media Interchange

# 5.1 Implementation Model

#### 5.1.1 Implementation Data Flow

Figure 13. Data Flow Diagram

#### 5.1.2 Functional Definition of AEs

#### 5.1.2.1 Functional Definition of Offline-Media Application Entity

The Offline-Media Application Entity is activated upon user request on selected studies or on a particular opened study. It performs the following:

- copies DICOM Information Objects to a local storage device;
- creates a DICOMDIR file that represents the Information Objects to be recorded;
- records the Information Objects and the DICOMDIR file to an ISO 9660 image file.

# 5.1.3 Sequencing of Real-World Activities

## 5.1.3.1 Activity – Export DICOM studies

At least one study must be selected in search results, or opened for viewing. By pressing the "Export" button, the "Export" window is opened. Selecting the option group "Export DICOM studies and portable viewer" and choosing "ISO disk image" for "Media", then pressing the "Start" button, will pass the currently selected patient(s), study (or studies) and their images to Offline-Media AE.

A DICOM Data Set (SOP Instance) will be copied for each image from the PACS into a staging area; if a size limit has been chosen in the "Export" window, then a new dedicated staging area is created every time when the total size of copied files would exceed the limit. In each staging area, a DICOMDIR file is created that indexes all SOP Instances present there. Then an ISO 9660 disc image file is created for each staging area, including both DICOMDIR and SOP Instances, and presented as results of the operation in the "Export" window.

The end user is supposed to download every ISO file (volume) to the local machine, then use a third-party solution (software and hardware) to burn them to physical media and label related discs appropriately. On Windows it is possible to configure the shell to start the built-in burning tool as soon as the browser "opens" a downloaded file.

## 5.1.3.2 Implementation Class and Version

In most cases each SOP Instance is copied from the PACS via interfaces that retain its original File Meta header. Consequently, their implementation information is PACS-dependent.

However, files received by the Storage Server AE (integration over Query/Retrieve or the Query/Retrieve-based fallback scenario for DCM4CHEE PACS), and the DICOMDIR file created by MedDream when exporting studies in ISO format, have the following implementation information in its File Meta header:

Table 32. Implementation Class and Version for Offline-Media AE

	Table 32. Implementation Glass and Version for Chiline Wedia AL
Name	Value
Implementation Class UID	1.3.6.1.4.1.44316.0.1.2

# 5.2 Offline-Media AE Specification

## 5.2.1 Profiles, Activities and Roles

The Offline-Media AE provides standard conformance to Media Storage Service Class (PS 3.4), the File Format Class (PS 3.10) and the Media Storage Application Profile (PS 3.11). The profiles and roles are as follows:

Table 33. Offline-Media AE Specification

Application Profile	Real World Activity	Role
STD-GEN-CD	Export DICOM studies	FSC

#### 5.2.1.1 File Meta Information for the Application Entity

The Offline-Media AE does not set the Source Application Entity Title.

# 5.2.2 Activity - Export DICOM studies

The Offline-Media AE acts as an FSC when requested to export SOP Instances from the PACS to an ISO disc image.

If the medium size limit has been chosen when starting the operation, then Offline-Media AE may create multiple volumes; in that case it attempts to fit as much files as possible into each volume.

The volume label is automatically generated in form "VOL1\_ISO", "VOL2\_ISO" ... "VOLn\_ISO".

When the AE is configured to add a portable viewer to each volume, this viewer can only display images present in a particular volume, as the corresponding DICOMDIR file only refers to SOP Instances on this volume. There is no provision to avoid splitting a series or a study across volumes, and to reference related volumes or even indicate the missing SOP Instances. Naïve copying of volume contents into a common directory tree will result in file/directory name collisions because grouping of SOP Instances by series, study and patient restarts anew in every volume. As a result, splitting into volumes is only practical when using limited-size media for offline transfer of SOP Instances to another PACS, which can individually import them back and therefore present each study as a whole.

#### 5.2.3 SOP Classes

As a general rule, the Offline-Media AE supports at least the same set of SOP Classes and Transfer Syntaxes as the Storage Server AE (everything that can be received over the network is exportable). It also supports the Media Storage Directory for created DICOMDIR files.

Table 34. SOP Classes and Transfer Syntaxes for the STD-GEN-CD Profile

# 5.2.4 Augmented and Private Application Profiles

Offline-Media AE does not support any augmented or private Profiles.

# 5.2.5 Media Configuration

Not applicate to Offline-Media AE.

# 5.2.6 Basic Directory IOD

The table below lists structural attributes needed in the DICOMDIR file, and also attributes that are copied from the DICOM files being indexed.

Table 35. Basic Directory IOD – Module "Directory Information"

Attribute Name	Tag	VR	Туре	Description
Offset of the First Directory Record of the Root Directory Entity	(0004,1200)	UL	1	Offset of the first byte (of the Item Data Element) of the first Directory Record of the Root Directory Entity. This Offset is a number of bytes starting with the first byte of the File Meta Information (includes the File Preamble and the DICM Prefix).
Offset of the Last Directory Record of the Root Directory Entity	(0004,1202)	UL	1	Offset of the first byte (of the Item Data Element) of the last Directory Record of the Root Directory Entity. This Offset is a number of bytes starting with the first byte of the File Meta Information (includes the File Preamble and the DICM Prefix).
File-set Consistency Flag	(0004,1212)	US	1	Always 0000H (no known inconsistencies)
Directory Record Sequence	(0004,1220)	SQ	2	Sequence of zero or more Items where each Item contains a Directory Record by including the Directory Elements from (0004,1400) to (0004,1511) and Record selection Keys as defined in subsequent tables
>Offset of the Next Directory Record	(0004,1400)	UL	1	Offset of the first byte (of the Item Data Element) of the next Directory Record of the same Directory Entity. This Offset is an unsigned integer representing a number of bytes starting with the first byte of the File Meta-information (includes the File Preamble and the DICM Prefix).
>Record In-use Flag	(0004,1410)	US	1	Always FFFFH (record is in use)
>Offset of Referenced Lower-Level Directory Entity	(0004,1420)	UL	1	Offset of the first byte (of the Item Data Element) of the first Directory Record of the Referenced Lower Level Directory Entity. This Offset is a number of bytes starting with the first byte of the File Meta Information (includes the File Preamble and the DICM Prefix).
				When no lower-level Directory Entity (containing at least one Directory Record) is referenced, this Attribute shall have a Value of 00000000H.
>Directory Record Type	(0004,1430)	CS	1	Defines a specialized type of Directory Record by reference to its position in the Media Storage Directory Information Model.  Enumerated Values: "PATIENT", "STUDY", "SERIES", "IMAGE", "RT DOSE", "RT STRUCTURE SET", "RT PLAN", "PRESENTATION", "WAVEFORM", "SR DOCUMENT", "SPECTROSCOPY", "RAW DATA", "ENCAP DOC".
>Referenced File ID	(0004,1500)	CS	1C	A Multiple Value that represents the ordered components of the File ID containing a "referenced object" or Referenced SOP Instance.
				Present if the Directory Record references a SOP Instance - that is, record type is not "PATIENT", "STUDY" and

				"IMAGE".
				The Viewer uses up to 4 components, with up to 8 characters in each. The first component is always "PAT" + ordinal number; in a similar fashion deeper levels use prefixes "STU", "SER" and "IMA" (the latter is the same for any SOP Class).
>Referenced SOP Class UID in File	(0004,1510)	UI	1C	Unique ID for the SOP Class of the Instance stored in the referenced File.
Class OID III File				referenced File.
				Required if the Directory Record references a SOP
				Instance.
>Referenced SOP	(0004,1511)	UI	1C	Unique Identifier for the SOP Instance stored in the
Instance UID in File				referenced file.
				Present if the Directory Record references a SOP Instance.
>Referenced	(0004,1512)	UI	1C	Unique Identifier for the Transfer Syntax used to encode the
Transfer Syntax UID				Instance stored in the referenced file.
in File				
				Required if the Directory Record references a SOP
				Instance.
>Include Record Sele	ction Keys (see	e sub	seque	ent tables)

NOTE: in the subsequent tables the attribute is merely copied from the indexed file if available. There is no provision

- to convert a missing attribute to an empty one for Type 2, or
- to fail the export (or at least warn the operator) if a Type 1 attribute is missing, or
- to verify the actual condition behind Type 1C.

Table 36. Basic Directory IOD – Keys of "PATIENT" Directory Record

Attribute Name	Tag	VR	Туре	Description
Specific Character	(0008,0005)	CS	1C	Character Set that expands or replaces the Basic Graphic
Set				Set
Patient's Name	(0010,0010)	PΝ	2	Patient's full name
Patient ID	(0010,0020)	LO	1	Primary identifier for the Patient

Attribute Name	Tag	VR	Type	Description
7 tti ibato italio	ıug			-
Specific Character	(0008,0005)	CS	1C	Character Set that expands or replaces the Basic Graphic
Set				Set
Study Date	(0008,0020)	DA	1	Date the Study started
Study Time	(0008,0030)	TM	1	Time the Study started
Accession Number	(0008,0050)	SH	2	A departmental Information System generated number that
				identifies the Imaging Service Request
Study Description	(0008,1030)	LO	2	Institution-generated description or classification of the
				Study (component) performed
Study Instance UID	(0020,000D)	UI	1C	Unique identifier for the Study.
				Always present.
Study ID	(0020,0010)	SH	1	User or equipment generated Study identifier

Table 38. Basic Directory IOD – Keys of "SERIES" Directory Record

				Table 30. Dasic Directory TOD - Neys of SENIES Directory Necord
Attribute Name	Tag	VR	Type	Description
Modality	(0008,0060)	CS	_	Type of device, process or method that originally acquired or produced the data used to create the Instances in this Series
Series Instance UID	(0020,000E)	UI	1	Unique identifier of the Series

Series Number	(0020,0011) IS		A number that identifies the Series
---------------	----------------	--	-------------------------------------

Table 39. Basic Directory IOD - Keys of "IMAGE" Directory Record

Attribute Name	Tag	VR	Туре	Description
Instance Number	(0020,0013)	IS	1	A number that identifies the image

Table 40. Basic Directory IOD - Keys of "RT DOSE" Directory Record

Attribute Name	Tag	VR	Туре	Description
Instance Number	(0020,0013)	IS	1	A number that identifies the object
Dose Summation	(3004,000A)	CS	1	Type of dose summation
Туре				

Table 41. Basic Directory IOD – Keys of "RT STRUCTURE SET" Directory Record

Attribute Name	Tag	VR	Type	Description
Specific Character	(0008,0005)	CS	1C	Character Set that expands or replaces the Basic Graphic
Set				Set
Instance Number	(0020,0013)	IS	1	A number that identifies the object
Structure Set Label	(3006,0002)	SH	1	User-defined label for Structure Set
Structure Set Date	(3006,0008)	DA	2	Date at which Structure Set was last modified
Structure Set Time	(3006,0009)	TM	2	Time at which Structure Set was last modified

Table 42. Basic Directory IOD - Keys of "RT PLAN" Directory Record

Attribute Name	Tag	VR	Туре	Description
Specific Character	(0008,0005)	CS	1C	Character Set that expands or replaces the Basic Graphic
Set				Set
Instance Number	(0020,0013)	IS	1	A number that identifies the object
RT Plan Label	(300A,0002)	SH	1	User-defined label for treatment plan
RT Plan Date	(300A,0006)	DA	2	Date treatment plan was last modified
RT Plan Time	(300A,0007)	TM	2	Time treatment plan was last modified

Table 43. Basic Directory IOD – Keys of "PRESENTATION" Directory Record

Attribute Name	Tag	VR	Type	Description
Specific Character	(0008,0005)	CS	1C	Character Set that expands or replaces the Basic Graphic
Set				Set
Referenced Series	(0008,1115)	SQ	1C	Sequence of Items where each Item includes the Attributes
Sequence				of one Series to which the Presentation applies
Instance Number	(0020,0013)	IS	1	A number that identifies the object
Content Label	(0070,0080)	CS	1	A label that is used to identify the indexed presentation
Content Description	(0070,0081)	LO	2	A description of the content of the indexed presentation
Presentation	(0070,0082)	DA	1	Date on which the indexed presentation was created
Creation Date				
Presentation	(0070,0083)	TM	1	Time at which the indexed presentation was created
Creation Time				
Content Creator's	(0070,0084)	PN	3	Name of operator (such as a technologist or physician)
Name				creating the content of the presentation

Table 44. Basic Directory IOD – Keys of "WAVEFORM" Directory Record

Attribute Name	Tag	VR	Type	Description
Content Date	(0008,0023)	DA	1	The date the content creation started
Content Time	(0008,0033)	TM	1	The time the content creation started
Instance Number	(0020,0013)	IS	1	A number that identifies the object

Table 45. Basic Directory IOD - Keys of "SR DOCUMENT" Directory Record

Attribute Name	Tag	VR	Туре	Description
Specific Character	(0008,0005)	CS	1C	Character Set that expands or replaces the Basic Graphic

Set				Set
Content Date	(0008,0023)	DA	1	The date the content creation started
Content Time	(0008,0033)	TM	1	The time the content creation started
Instance Number	(0020,0013)	IS	1	A number that identifies the object
Verification DateTime	(0040,A030)	DT	1C	Most recent Date and Time of verification among those
				defined in the Verifying Observer Sequence (0040,A073)
Concept Name Code	(0040,A043)	SQ	1	Code describing the concept represented by the root
Sequence				Content Item (Document Title)
Content Sequence	(0040,A730)	SQ	1C	Contains the Target Content Items that modify the Concept
				Name Code Sequence of the root Content Item (Document
				Title).
				All, and only, Content Items with the HAS CONCEPT MOD
				relationship from the root Content Item shall be included in
				this Sequence.
Completion Flag	(0040,A491)	CS	1	The estimated degree of completeness of this SR
				Document
Verification Flag	(0040,A493)	CS	1	Indicates whether this SR Document is Verified

Table 46. Basic Directory IOD - Keys of "SPECTROSCOPY" Directory Record

Attribute Name	Tag	VR	Туре	Description
Image Type	(0008,0008)	CS	1	Image identification characteristics
Content Date	(0008,0023)	DA	1	The date the content creation started
Content Time	(0008,0033)	TM	1	The time the content creation started
Referenced Image	(0008,9092)	SQ	1C	Full set of Composite SOP Instances referred to inside the
Evidence Sequence				Referenced Image Sequences of this Enhanced MR Image
				SOP Instance
Instance Number	(0020,0013)	IS	1	A number that identifies the object
Number of Frames	(0028,0008)	US	1	Number of frames in a Multi-frame Image
Rows	(0028,0010)	US	1	Number of rows in the image
Columns	(0028,0011)	US	1	Number of columns in the image
Data Point Rows	(0028,9001)	UL	1	Number of rows of data points in spectroscopic data
Data Point Columns	(0028,9002)	UL	1	Number of columns of data points in spectroscopic data

Table 47. Basic Directory IOD – Keys of "RAW DATA" Directory Record

Attribute Name	Tag	VR	Type	Description
Content Date	(0008,0023)	DA	1	The date the content creation started
Content Time	(0008,0033)	TM	1	The time the content creation started
Instance Number	(0020,0013)	IS	1	A number that identifies the object

Table 48. Basic Directory IOD – Keys of "ENCAP DOC" Directory Record

Attribute Name	Tag	VR	Type	Description
Specific Character	(0008,0005)	CS	1C	Character Set that expands or replaces the Basic Graphic
Set				Set
Content Date	(0008,0023)	DA	2	The date the content creation started
Content Time	(0008,0033)	TM	2	The time the content creation started
Instance Number	(0020,0013)	IS	1	A number that identifies the object
Concept Name Code	(0040,A043)	SQ	2	Code describing the concept represented by the root
Sequence				Content Item (Document Title)
Document Title	(0042,0010)	ST	2	The title of the document
MIME Type of En-	(0042,0012)	LO	1	The type of the encapsulated document stream described
capsulated Docu-				using the MIME Media Type
ment				

Table 49. Basic Directory IOD – Mapping of SOP Class UID to Record Type

SOP Class UID of the indexed object	Assigned (0004,1430) Directory Record Type
1.2.840.10008.5.1.4.1.1.1	IMAGE

1.2.840.10008.5.1.4.1.1.1.1	
1.2.840.10008.5.1.4.1.1.1.2

1.2.840.10008.5.1.4.1.1.4.2	SPECTROSCOPY
1.2.840.10008.5.1.4.1.1.66	RAW DATA
1.2.840.10008.5.1.4.1.1.104.1	ENCAP DOC

# 6 Support of Extended Character Sets MedDream supports ISO\_IR 192 (Unicode UTF-8) as an extended character set.

# 7 Security

The DICOM capabilities of MedDream contain the following security features.

The Storage Server has the mandatory "acceptAETitles" parameter that lists acceptable Remote AE Titles; it is not possible to configure association acceptance from any title. There also are optional parameters "allowedIps" for remote IP address filtering, and "address" for binding to a single particular IP address available in the system instead of all addresses.

TLS and its mutual authentication is only supported for DICOMweb transactions (not for DIMSE), and must be configured globally via JVM command-line options javax.net.ssl.trustStore / javax.net.ssl.keyStore.

It is assumed that the Software is used within a secured environment. It is assumed that a secured environment includes at a minimum:

- firewall or router protections to ensure that the Software only has network access to approved external hosts and services;
- appropriate secure network channels (e.g., such as a Virtual Private Network) for any communication with external hosts and services outside the locally secured environment.

Other network security procedures such as automated intrusion detection may be appropriate in some environments. Additional security features may be established by the local security policy and are beyond the scope of this conformance statement.

#### 8 Annexes

## 8.1 IOD Contents

# 8.1.1 Created SOP Instances

Abbreviations used for presence of values (PoV):

#### **VNAP**

Value Not Always Present (attribute has zero length if no value is present) – Applicable for Type 2 or 2C.

#### **ANAP**

Attribute is not always present – Applicable for Type 3.

#### **ALWAYS**

Attribute is always present with a value – Applicable for Type 1 or 1C.

#### **EMPTY**

Attribute is sent without a value - Applicable for Type 2.

Abbreviations used for sources of data:

#### **USER**

Attribute value is generated from user input.

#### **COPY**

Attribute value is copied from the image being annotated. Some attributes can be copied from another annotation in the same series.

#### **AUTO**

Attribute value is generated automatically or is a constant.

#### **CONFIG**

Attribute value is a configurable parameter.

Attributes not critical for correct operation of the Viewer are not validated. At least custom enumerated values from a standards-noncompliant original might propagate further. However, the Viewer ensures ANAP by converting a missing attribute to an empty one during copy.

## 8.1.1.1 Secondary Capture Image IOD

Table 50. Use of Modules

IE	Module	Usage
Patient	Patient	MANDATORY
Study	General Study	MANDATORY
	Patient Study	OPTIONAL
Series	General Series	MANDATORY
Equipment	General Equipment	OPTIONAL
	SC Equipment	MANDATORY
Image	General Image	MANDATORY
	General Reference	MANDATORY
	Image Pixel	MANDATORY
	SOP Common	MANDATORY

The General Reference module is not MANDATORY in the standard but is always present in SC instances produced by Viewer.

Table 51. Secondary Capture Image IOD - Module "Patient"

Tag	Туре	VR	Name	Description	PoV	Source
(0010,0010)	2	PN	Patient's Name	Patient's full name	VNAP	COPY
(0010,0020)	2	LO	Patient ID	Primary identifier for the Patient. The setting "com.softneta.meddream. newObjectsUseMetadataFromPacs" controls whether the value is copied from file or from PACS-indexed metadata.	VNAP	COPY
(0010,0021)	3	LO	Issuer of Patient ID	Identifier of the Assigning Authority (system, organization, agency, or	ANAP	COPY

				department) that issued the Patient		
				ID.		
(0010,0030)	2	DA	Patient's Birth Date	Birth date of the Patient	VNAP	COPY

# 8.1.1.3 Grayscale Softcopy Presentation State IOD

Table 70. Grayscale Softcopy Presentation State IOD – Use of Modules

IE	Module	Usage
Patient	Patient	MANDATORY
Study	General Study	MANDATORY
	Patient Study	OPTIONAL
Series	General Series	MANDATORY
	Presentation Series	MANDATORY
Equipment	General Equipment	MANDATORY
Presentation	Presentation State Identification	MANDATORY
	Presentation State Relationship	MANDATORY

Displayed Area	MANDATORY
Graphic Annotation	OPTIONAL
Spatial Transformation	MANDATORY
Graphic Layer	OPTIONAL
Softcopy VOI LUT	OPTIONAL
Softcopy Presentation LUT	MANDATORY
SOP Common	MANDATORY

The General Equipment and Spatial Transformation modules are not mandatory in the standard but are always present in GSPS instances produced by Viewer.

The modules Display Shutter and Bitmap Display Shutter are optional in the standard and not supported by Viewer neither for creation nor for display. As a result, the mandatory Presentation State Shutter module related to them is not applicable. The same situation is with the optional Mask module and a related mandatory Presentation State Mask module.

			Number	the Referenced SOP Instance to		
				which the reference applies. The first		
				frame shall be denoted as frame		
				number 1.		
				Present when annotating a multi-		
				frame image, and can only have a		
				single value.		

A GSPS created by Viewer is always intended for a single image.

Table 79 . Grayscale Softcopy Presentation State IOD – Module "Displayed Area"

Tag	Туре	VR	Name	Description	PoV	Source
(0070,005A)	1	SQ	Displayed Area Selection Sequence	A Sequence of Items each of which describes the displayed area selection for a group of images or frames.	ALWAYS	AUTO
				Always contains a single Item.		
>(0070,0052)	1	SL	Displayed Area Top Left Hand Corner	The top left (after spatial transformation) pixel in the referenced image to be displayed, given as column\row. Column is the horizontal (before spatial transformation) offset (X) and row is the vertical (before spatial transformation) offset (Y) relative to the origin of the pixel data before spatial transformation, which is 1\1.	ALWAYS	AUTO
>(0070,0053)	1	SL	Displayed Area Bottom Right Hand Corner	The bottom right (after spatial transformation) pixel in the referenced image to be displayed, given as column\row. Column is the horizontal (before spatial transformation) offset (X) and row is	ALWAYS	AUTO

				the vertical (before spatial transformation) offset (Y) relative to the origin of the pixel data before spatial transformation, which is 1\1.		
>(0070,0100)	1	CS	Presentation Size Mode	Manner of selection of display size.  Enumerated Values: "SCALE TO FIT", "TRUE SIZE".	ALWAYS	AUTO
>(0070,0102)	1C	IS	Presentation Pixel Aspect Ratio	Ratio of the vertical size and the horizontal size of the pixels in the referenced image, to be used to display the referenced image, specified by a pair of integer values where the first value is the vertical pixel size and the second value is the horizontal pixel size.  When creating the GSPS, is copied from the image being annotated.  When applying the GSPS, this attribute is ignored.	ALWAYS	AUTO

The standard value "MAGNIFY" of Presentation Size Mode is never used in GSPS instances created by Viewer.

Table 80. Grayscale Softcopy Presentation State IOD – Module "Graphic Annotation"

Tag	Туре	VR	Name	Description	PoV	Source
(0070,0001)	1	SQ	Graphic Annotation Sequence	A Sequence of Items each of which represents a group of annotations composed of graphics or text or both.  Contains at least one Item.	ALWAYS	AUTO
>(0070,0002)	1	CS	Graphic Layer	The layer defined in the Graphic Layer Module in which the graphics or text is to be rendered.	ALWAYS	AUTO
>(0070,0008)	1C		Text Object Sequence	Sequence that describes a text annotation. Either this attribute or Graphic Object Sequence, or both, are required.  Present if a measurement contains text objects. Contains at least one Item.	ANAP	AUTO
>>(0070,0003)	1C	CS	Bounding Box Annotation Units	Units of measure for the axes of the text bounding box. Required if Bounding Box Top Left Hand Corner or Bounding Box Bottom Right Hand Corner is present.  The Viewer always adds this attribute with value "PIXEL": Image relative position specified with sub-pixel resolution such that the origin, which is at the Top Left Hand Corner (TLHC) of the TLHC pixel is 0.0\0.0, the Bottom Right Hand Corner (BRHC) of the TLHC pixel is 1.0\1.0, and the BRHC of the BRHC pixel is Columns\Rows.	ALWAYS	AUTO
>>(0070,0004)	1C	CS	Bounding Box Annotation Units	Units of measure for the axes of the text anchor point annotation.	ALWAYS	AUTO

				Required if Anchor Point is present.		
				The Viewer always adds this attribute with value "PIXEL".		
>>(0070,0006)	1	ST	Unformatted Text Value	Text data that is unformatted and whose manner of display within the defined bounding box or relative to the specified anchor point is implementation dependent.	ALWAYS	USER, AUTO
				Contains user-entered text (for the measurement "Text") or autogenerated text (for most other measurements).		
>>(0070,0010)	1C	FL	Bounding Box Top Left Hand Corner	Location of the Top Left Hand Corner (TLHC) of the bounding box in which Unformatted Text Value is to be displayed, in Bounding Box Annotation Units, given as column\row. Column is the horizontal offset and row is the vertical offset. Required if Bounding Box Bottom Right Hand Corner is present.  Always present with two values.	ALWAYS	AUTO
>>(0070,0011)	1C	FL	Bounding Box Bottom Right Hand Corner	Location of the Bottom Right Hand Corner (BRHC) of the bounding box in which Unformatted Text Value is to be displayed, in Bounding Box Annotation Units, given as column\row. Column is the horizontal offset and row is the vertical offset. Required if Bounding Box Top Left Hand Corner is present.  Always present with two values.	ALWAYS	AUTO
>>(0070,0012)	1C	CS	Bounding Box Text Horizontal Justification	Location of the text relative to the vertical edges of the bounding box. Required if Bounding Box Top Left Hand Corner is present.  The Viewer always adds this attribute with value "LEFT".	ALWAYS	AUTO
>>(0070,0014)	1C		Anchor Point	Location of a point in the image or Specified Displayed Area to which the Unformatted Text Value is related, in Anchor Point Annotation Units, given as column\row. Column is the horizontal offset and row is the vertical offset. Required if Bounding Box Top Left Hand Corner and Bounding Box Bottom Right Hand Corner are not present.	ALWAYS	AUTO
>>(0070,0015)	1C	CS	Anchor Point Visibility	Flag to indicate whether or not a visible indication (such as a line or arrow) of the relationship between the text and the anchor point is to be displayed. Required if Anchor Point is present.	ALWAYS	AUTO

				Environmenta di Valvano IIVII IINIII Tha		
				Enumerated Values: "Y", "N". The		
				Viewer may use "Y" if the		
				measurement has been edited		
				manually by moving the text away		
				from its original location.		
>>(0070,0231)	3	SQ	Text Style	Sequence that describes the text	ALWAYS	AUTO
			Sequence	style.		
				Always present with a single Item.		
>>>(0070,0229)	1	LO	CSS Font Name	Generic font name as defined within	ALWAYS	AUTO
				CSS (Cascading Style Sheets).		
				The Viewer always uses "Arial".		
>>>(0070,0241)	1	US	Text Color	A default color triplet value used to	ALWAYS	AUTO,
			CIELab Value	specify the text color in which it is		CONFIG
				recommended that the text be		
				rendered on a color display. The		
				units are specified in PCS-Values,		
				and the value is encoded as CIELab.		
>>>(0070,0242)	1C	CS	Horizontal Align-	Specifies the horizontal position of	ALWAYS	AUTO
			ment	the text relative to the vertical edges		
				of the bounding box. Required if		
				Bounding Box Top Left Hand Corner		
				is present.		
				Enumerated Values: "LEFT",		
				"CENTER", "RIGHT".		
>>>(0070,0243)	1C	CS	Vertical Alignment	Specifies the vertical position of the	ALWAYS	AUTO
				text relative to the horizontal edges of		
				the bounding box. Required if		
				Bounding Box Top Left Hand Corner		
				is present.		
				Enumerated Values: "TOP",		
				"CENTER", "BOTTOM".		
>>(0070,0244)	1	CS	Shadow Style	The shadow style of the text to be	ALWAYS	AUTO
,				displayed.		
				The Viewer always uses "OFF" (no		
				shadow).		
>>(0070,0248)	1	CS	Underlined	Specifies whether or not the text shall	ALWAYS	AUTO
				be rendered underlined.		
				The Viewer always uses "N" (no		
				underline).		
>>(0070,0249)	1	CS	Bold	Specifies whether or not the text shall	ALWAYS	AUTO
				be rendered in bold.		
				The Viewer always uses "N" (not		
				bold).		
>>(0070,0250)	1	CS	Italic	Specifies whether or not the text shall	ALWAYS	AUTO
				be rendered italicized.		
				The Viewer always uses "N" (not		
				italic).		
>(0070,0009)	1C	SQ	Graphic Object	Sequence that describes a graphic	ANAP	AUTO
, , , , , , , , , , , , , , , , , , ,	-		Sequence	annotation. Either this attribute or		-
				Text Object Sequence, or both, are		
				required.		
<u> </u>		<del></del>	<u> </u>	I	1	

				Present if a measurement contains graphic objects. Contains at least one Item.		
>>(0070,0005)	1	CS	Graphic Annotation Units	Units of measure for the axes of the graphic annotation.	ALWAYS	AUTO
				The Viewer always uses "PIXEL".		
>>(0070,0020)	1	US	Graphic Dimen- sions	Always "2"	ALWAYS	AUTO
>>(0070,0021)	1	US	Number of Graph- ic Points	Number of data points in this graphic	ALWAYS	AUTO
>>(0070,0022)	1	FL	Graphic Data	Coordinates that specify this graphic annotation.	ALWAYS	AUTO
>>(0070,0023)	1	CS	Graphic Type	Contains at least 2 values.  The shape of graphic that is to be drawn.	ALWAYS	AUTO
				Enumerated Values: "POINT", "POLYLINE", "INTERPOLATED", "CIRCLE", "ELLIPSE".		
>>(0070,0024)	1C	CS	Graphic Filled	Whether or not the closed graphics element is displayed as filled (in some unspecified manner that shall be distinguishable from an outline) or as an outline. Required if Graphic Data is "closed".	ANAP	AUTO
				Enumerated Values: "Y", "N". Absent for some kinds of graphic primitives, like POINT.		
>>(0070,0226)	3	UL	Compound Graphic Instance ID	The identifier of the Compound Graphic represented, in part, by this Item. The value shall be equal to the value of Compound Graphic Instance ID of the corresponding Item in the Compound Graphic Sequence.	ANAP	AUTO
				Present in case of "Ellipse" and "Arrow Pointer" measurements.		
>>(0070,0232)	3	SQ	Line Style Sequence	Sequence that describes the line style.	ANAP	AUTO
				Contains a single Item. Absent in case of POINT.		
>>>(0070,0244)	1	CS	Shadow Style	The shadow style of the line to be displayed.  Always "OFF" (no shadow).	ALWAYS	AUTO
>>>(0070,0245)	1	FL	Shadow Offset X	Floating point value that defines the shadow offset in X direction in Graphic Annotation Units).  Always 0.	ALWAYS	AUTO
>>>(0070,0246)	1	FL	Shadow Offset Y	Floating point value that defines the shadow offset in Y direction in Graphic Annotation Units (0070,0005).	ALWAYS	AUTO
>>> (0070,0247)	1	FL	Shadow Color	Always 0. A color triplet value used to encode	ALWAYS	CONFIG

			CIELab Value	the Shadow Color. The units are specified in PCS-Values, and the value is encoded as CIELab.  Despite the fact that the shadow is not used, the value comes from "Measurements / Color" in Settings window.		
>>>(0070,0251)	1	US	Pattern On Color CIELab Value	A color triplet value used to encode the foreground. The units are specified in PCS-Values, and the value is encoded as CIELab.  The value is configurable as "Measurements / Color" in Settings window.	ALWAYS	CONFIG
>>(0070,0253)	1	FL	Line Thickness	Specifies the line thickness in pixels.	ALWAYS	AUTO, CONFIG
>>>(0070,0254)	1	CS	Line Dashing Style	The dashing style of the line to be displayed.  Enumerated Values: "SOLID", "DASHED".	ALWAYS	AUTO
>>>(0070,0255)	1C	UL	Line Pattern	Pattern that defines the line dashing style. If the bit inside the pattern is set to 1 the foreground color is drawn, else the background color is drawn.  Present when the dashing style is "DASHED", and the value is always 255.	ANAP	AUTO
>>>(0070,0258)	1	FL	Shadow Opacity	Encodes the shadow opacity. The value is encoded as floating point alpha value (0.0-1.0).	ALWAYS	AUTO
>>(0070,0284)	1	FL	Pattern On Opaci-	Always zero.  Encodes the foreground opacity as	ALWAYS	AUTO
			ty	floating point alpha value (0.0-1.0).  The Viewer always uses 1.0.		
>(0070,0209)	3	SQ	Compound Graphic Sequ- ence	A Sequence of Items that describe Compound Graphics.  Is present with at least one Item for measurements "Arrow Pointer" and "Oval", and absent otherwise.	ANAP	AUTO
>>(0070,0020)	1	US	Graphic Dimen- sions	Always "2"	ALWAYS	AUTO
>>(0070,0021)	1	US		Number of data Items, e.g., points, in this Compound Graphic	ALWAYS	AUTO
>>(0070,0022)	1	FL	Graphic Data	Numerical data Items that specify this Compound Graphic (points, vectors and scalars).  Contains at least 2 values.	ALWAYS	AUTO
>>(0070,0024)	1C	CS	Graphic Filled	Indicates whether or not the Compound Graphics is displayed as filled. Required for "ELLIPSE" graphics.	ALWAYS	AUTO

				Enumerated values: "Y", "N".

(0008,0018)	1	UI	SOP Instance UID	Uniquely identifies the SOP Instance.	ALWAYS	AUTO
				Always a new UID.		

## 8.1.1.4 RT Structure Set IOD

Table 86. Use of Modules

IE	Module	Usage
Patient	Patient	MANDATORY
Study	General Study	MANDATORY
	Patient Study	OPTIONAL
Series	RT Series	MANDATORY
Equipment	General Equipment	MANDATORY
Structure Set	Structure Set	MANDATORY
	ROI Contour	MANDATORY
	RT ROI Observations	MANDATORY
	SOP Common	MANDATORY

The General Equipment and Frame of Reference modules are not mandatory in the standard but are always present in RTSTRUCT instances produced by Viewer.

The Frame of Reference module is mandatory in standard but not present here. The Viewer uses the RTSTRUCT format for its own annotations that don't fully correspond to real radiotherapy scenarios. In particular, copying a Frame of Reference UID from the object being annotated is not always possible: some studies like DX never contain it, while for other studies multiple series can be annotated with the same RTSTRUCT object and there is no checking whether their frames of reference are identical. An example with incompatible coordinate systems wasn't encountered so far.

Table 87. RT Structure Set IOD - Module "Patient"

Tag	Туре	VR	Name	Description	PoV	Source
(0010,0010)	2	PN	Patient's Name	Patient's full name	VNAP	COPY
(0010,0020)	2	LO	Patient ID	Primary identifier for the Patient.	VNAP	COPY
				The setting "com.softneta.meddream. newObjectsUseMetadataFromPacs" controls whether the value is copied from file or from PACS-indexed metadata.		

(0010,0021)	3	LO	Issuer of Patient ID	Identifier of the Assigning Authority	ANAP	COPY
				(system, organization, agency, or		
				department) that issued the Patient		
				ID.		
(0010,0030)	2	DA	Patient's Birth Date	Birth date of the Patient	VNAP	COPY
(0010,0032)	3	TM	Patient's Birth Time	Birth time of the Patient	ANAP	COPY
(0010,0040)	2	CS	Patient's Sex	Sex of the Patient	VNAP	COPY
(0010,1000)	3	LO	Other Patient IDs	Other identification numbers or codes	ANAP	COPY
			(RETIRED)	used to identify the patient		
(0010,1001)	3	PN	Other Patient	Other names used to identify the	ANAP	COPY
			Names	Patient		
(0010,2160)	3	SH	Ethnic Group	Ethnic group or race of the Patient	ANAP	COPY
(0010,4000)	3	LT	Patient Comments	User-defined additional information	ANAP	COPY
				about the Patient		

Table 88. RT Structure Set IOD – Module "General Study"
