

Arterial Leadercath (PTFE)

Code produit: 5118.908

Arterial Leadercath is a catheter for arterial access inserted by the Seldinger technique.
Although it can be inserted in a variety of arteries, the most common sites for the placement of this catheter are the radial and the femoral artery.
The Seldinger technique makes arterial puncture easier particularly in hypotensive patients with a weak peripheral pulse and when arteries are atherosclerosed or narrow.

- The product is supplied in a peel-pack containing:
- ✓ 1 stainless-steel puncture needle,
 - ✓ 1 transparent PTFE (polytetrafluoroethylene) catheter with 2 black radiopaque lines and hub with fixation wings,
 - ✓ 1 straight metallic guidewire.

20/180
