---------------------------	--	-------------	-------------	------

CORE MATERIALS

3 different core material options offer varied levels of strength, flexibility, and durability

- Stainless steel offers support and tip shape retention
- DURASTEEL is stronger than conventional stainless steel for outstanding durability
- ELASTINITE Nitinol is known for its flexible and durable properties

Stainless Steel

DURASTEEL

ELASTINITE Nitinol

CORE DIAMETER AND SUPPORT

Support is a measure of a guide wire's resistance to a bending force

- A more supportive wire can aid in bulky device delivery
- A less supportive wire is designed to be flexible and can aid in access through tortuous anatomy

More Support and Straightening

Less Support and More Flexibility

CORE TAPERS

Our core taper designs provide excellent guide wire tracking

- Longer core tapers yield superb wire tracking and a lower propensity to prolapse
- Shorter core tapers yield longer segments of consistent support but provide increased propensity to prolapse
- Response core tapers engineered with a parabolic grind is designed to maximize tracking while providing progressive support

Longer Step Taper

Shorter Taper

Response Parabolic Core Grind

TIP STYLES AND TIP LOAD

Offering 2 different tip styles with unique advantages and varied tip loads

- Shaping ribbon for tip softness and tip shapeability
- Core-to-tip design provides tactile feedback and tip control, enabling 1:1 torque
- Tip stiffness is a measure of the buckling force exerted by the tip of the wire on a surface. Abbott reports tip loads measured on the distal 10 mm of the tip
- High tip load helps cross challenging lesions
- Low tip load makes the tip very soft and atraumatic

Shaping Ribbon

Core-To-Tip

SPRING COIL COVERS

For outstanding torque transmission and control

- Spring coil design contributes to the wire's tactile feedback
- Platinum alloy tip coils are radiopaque and stainless steel coils are radiolucent

Stainless Steel Platinum

POLYMER COVERS

Designed for deliverability in tortuous anatomy and excellent distal access

- Full polymer covers over tip coils for outstanding delivery
- Intermediate polymer sleeve maintains exposed gentle tip coils while providing a lubricious surface for device delivery

Full Polymer Cover With Tip Coils

Intermediate Polymer Sleeve With Tip Coils

COATINGS

Precision-engineered coatings designed to reduce surface friction and improve device interaction and guide wire tracking

- Hydrophilic coatings (Hydrocoat or Turbocoat) attract water to create a slippery "gel-like" surface for lubricity and smooth device delivery
- Hydrophobic coatings (Microglide and SmoothGlide) repel water to create a "wax-like" surface for moderate lubricity and smooth device interaction

Caution: These products are intended for use by or under the direction of a physician. Prior to use, reference the Instructions for Use provided inside the product carton (when available), at eifu.abbottvascular.com or at Manuals.sjm.com for more detailed information on Indications, Contraindications, Warnings, Precautions and Adverse Events. **Information contained herein for distribution outside the U.S. only.** Check the regulatory status of the device in areas where CE marking is not the regulation in force.

Tests performed by and data on file at Abbott. All tip stiffness values are averages, based on a sample of 5 guide wires, tested with an automated machine in a controlled environment. All Device Support Level values are test results on a single guide wire under the same ambient conditions. Illustrations are artist's representations only and should not be considered as engineering drawings or photographs.
